 Q.E.D.

C.96 Proofs for General (constants.pvs)

C.96.1 General.Byte_TCC1

Terse proof for `Byte_TCC1`.

`Byte_TCC1`:

{1} $0 < \text{max_byte}$

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of `Byte_TCC1`.
 Q.E.D.

C.96.2 General.less_than_max_byte

Terse proof for `less_than_max_byte`.

`less_than_max_byte`:

{1} $\forall (n: \text{nat}): n < \text{expt}(2, 8) \supset n < \text{max_byte}$

Repeatedly Skolemizing and flattening,
 Expanding the definition of `max_byte`,
 Applying `bits_per_byte_minimum`
 Expanding the definition of `min_bits_per_byte`,
 Applying `both_sides_expt_gt1_le`
 Instantiating the top quantifier in -1 with the terms: 2, 8, `bits_per_byte`,
 Simplifying, rewriting, and recording with decision procedures,
 This completes the proof of `less_than_max_byte`.
 Q.E.D.

C.97 Proofs for Graph (graph.pvs)

C.97.1 Graph.path?_TCC1

Terse proof for `path?_TCC1`.

`path?_TCC1`:

{1} $\forall (g: \text{graph_type}, l: (\text{path_list?}[T])):$
 $(\forall (i: \text{below}(\text{length}(l))): g.\text{nodes}(\text{nth}(l, i))) \supset$
 $(\forall (i_1: \text{below}(\text{length}[T](l) - 1)): i_1 < \text{length}[T](l))$

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of `path?_TCC1`.

Q.E.D.

C.97.2 Graph.path?_TCC2

Terse proof for path?_TCC2.

path?_TCC2:

$$\{1\} \quad \forall (g: \text{graph_type}, l: (\text{path_list?}[T])): \\ (\forall (i: \text{below}(\text{length}(l))): g' \text{nodes}(\text{nth}(l, i))) \supset \\ (\forall (i_1: \text{below}(\text{length}[T](l) - 1)): g' \text{nodes}(\text{nth}[T](l, i_1)))$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of path?_TCC2.

Q.E.D.

C.97.3 Graph.path?_TCC3

Terse proof for path?_TCC3.

path?_TCC3:

$$\{1\} \quad \forall (g: \text{graph_type}, l: (\text{path_list?}[T])): \\ (\forall (i: \text{below}(\text{length}(l))): g' \text{nodes}(\text{nth}(l, i))) \supset \\ (\forall (i_1: \text{below}(\text{length}[T](l) - 1)): i_1 + 1 < \text{length}[T](l))$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of path?_TCC3.

Q.E.D.

C.97.4 Graph.path?_TCC4

Terse proof for path?_TCC4.

path?_TCC4:

$$\{1\} \quad \forall (g: \text{graph_type}, l: (\text{path_list?}[T])): \\ (\forall (i: \text{below}(\text{length}(l))): g' \text{nodes}(\text{nth}(l, i))) \supset \\ (\forall (i_1: \text{below}(\text{length}[T](l) - 1)): g' \text{nodes}(\text{nth}[T](l, i_1 + 1)))$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of path?_TCC4.

Q.E.D.

C.97.5 Graph.nodes_path_start

Terse proof for nodes_path_start.

nodes_path_start:

$$\{1\} \quad \forall (g: \text{graph_type}, p: (\text{path?}(g))): g' \text{nodes}(\text{path_start}(p))$$

Repeatedly Skolemizing and flattening,
Expanding the definition of path_list?,
Expanding the definition of path_start,

Expanding the definition of path?,
 Applying disjunctive simplification to flatten sequent,
 Instantiating the top quantifier in -2 with the terms: 0,
 we get 2 subgoals:

nodes_path_start.1:

{-1}	$\text{length}(p') \geq 1$
{-2}	$g' \text{ nodes}(\text{nth}(p', 0))$
{-3}	$\forall (i: \text{below}(\text{length}(p') - 1)): g' \text{ edges}(\text{nth}(p', i), \text{nth}(p', 1 + i))$
{1}	$g' \text{ nodes}(\text{car}(p'))$

Expanding the definition of nth,
 which is trivially true.

This completes the proof of nodes_path_start.1.

nodes_path_start.2:

{-1}	$\text{length}(p') \geq 1$
{-2}	$\forall (i: \text{below}(\text{length}(p') - 1)): g' \text{ edges}(\text{nth}(p', i), \text{nth}(p', 1 + i))$
{1}	$0 < \text{length}[T](p')$
{2}	$g' \text{ nodes}(\text{car}(p'))$

Simplifying, rewriting, and recording with decision procedures,

This completes the proof of nodes_path_start.2.

Q.E.D.

C.97.6 Graph.nodes_path_end

Terse proof for nodes_path_end.

nodes_path_end:

{1}	$\forall (g: \text{graph_type}, p: (\text{path?}(g))): g' \text{ nodes}(\text{path_end}(p))$
-----	--

Repeatedly Skolemizing and flattening,
 Expanding the definition of path_list?,
 Expanding the definition of path_end,
 Expanding the definition of path?,
 Applying disjunctive simplification to flatten sequent,
 Instantiating quantified variables,
 Simplifying, rewriting, and recording with decision procedures,
 This completes the proof of nodes_path_end.

Q.E.D.

C.97.7 Graph.path_head_TCC1

Terse proof for path_head_TCC1.

path_head_TCC1:

{1}	$\forall (g: \text{graph_type}, p: (\text{path?}(g)), n: \text{upto}(\text{length}[T](p))):$ $n \geq 1 \supset \text{path_list?}[T](\text{head}[T](p, n))$
-----	---

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of path_head_TCC1.

Q.E.D.

C.97.8 Graph.path_head

Terse proof for path_head.

path_head:

$$\frac{}{\{1\} \quad \forall (g: \text{graph_type}, p: (\text{path?}(g)), n: \text{upto}(\text{length}(p))): \\ n \geq 1 \supset \text{path?}(g)(\text{head}(p, n))}$$

Repeatedly Skolemizing and flattening,

Expanding the definition of path?,

Installing automatic rewrites from: length_head length_tail nth_head nth_tail

Applying propositional simplification,

we get 2 subgoals:

path_head.1:

$$\frac{\begin{array}{l} \{-1\} \quad \text{path_list?}[T](p') \\ \{-2\} \quad \forall (i: \text{below}(\text{length}(p'))): g' \text{'nodes}(\text{nth}(p', i)) \\ \{-3\} \quad \forall (i: \text{below}(\text{length}(p') - 1)): g' \text{'edges}(\text{nth}(p', i), \text{nth}(p', 1 + i)) \\ \{-4\} \quad n' \leq \text{length}(p') \\ \{-5\} \quad n' \geq 1 \end{array}}{\{1\} \quad \forall (i: \text{below}(\text{length}(\text{head}(p', n')))): g' \text{'nodes}(\text{nth}(\text{head}(p', n'), i))}$$

Repeatedly Skolemizing and flattening,

Simplifying, rewriting, and recording with decision procedures,

Instantiating quantified variables,

This completes the proof of path_head.1.

path_head.2:

$$\frac{\begin{array}{l} \{-1\} \quad \text{path_list?}[T](p') \\ \{-2\} \quad \forall (i: \text{below}(\text{length}(p'))): g' \text{'nodes}(\text{nth}(p', i)) \\ \{-3\} \quad \forall (i: \text{below}(\text{length}(p') - 1)): g' \text{'edges}(\text{nth}(p', i), \text{nth}(p', 1 + i)) \\ \{-4\} \quad n' \leq \text{length}(p') \\ \{-5\} \quad n' \geq 1 \end{array}}{\{1\} \quad \forall (i: \text{below}(\text{length}(\text{head}(p', n')) - 1)): \\ g' \text{'edges}(\text{nth}(\text{head}(p', n'), i), \text{nth}(\text{head}(p', n'), 1 + i))}$$

Repeatedly Skolemizing and flattening,

Simplifying, rewriting, and recording with decision procedures,

Instantiating quantified variables,

This completes the proof of path_head.2.

Q.E.D.

C.97.9 Graph.path_tail_TCC1

Terse proof for path_tail_TCC1.

path_tail_TCC1:

$$\frac{}{\{1\} \quad \forall (g: \text{graph_type}, p: (\text{path?}(g)), n: \text{upto}(\text{length}[T](p))): \\ \text{length}(p) - n \geq 1 \supset \text{path_list?}[T](\text{tail}[T](p, n))}$$

Repeatedly Skolemizing and flattening,

Expanding the definition of path_list?,

Rewriting using length_tail, matching in *,

This completes the proof of path_tail_TCC1.

Q.E.D.

C.97.10 Graph.path_tail

Terse proof for path_tail.

path_tail:

$$\frac{}{\{1\} \quad \forall (g: \text{graph_type}, p: (\text{path?}(g)), n: \text{upto}(\text{length}(p))): \\ \text{length}(p) - n \geq 1 \supset \text{path?}(g)(\text{tail}(p, n))}$$

Repeatedly Skolemizing and flattening,

Expanding the definition of path?,

Installing automatic rewrites from: length_head length_tail nth_head nth_tail

Applying propositional simplification,

we get 2 subgoals:

path_tail.1:

$$\frac{\begin{array}{l} \{-1\} \quad \text{path_list?}[T](p') \\ \{-2\} \quad \forall (i: \text{below}(\text{length}(p'))): g' \text{'nodes}(\text{nth}(p', i)) \\ \{-3\} \quad \forall (i: \text{below}(\text{length}(p') - 1)): g' \text{'edges}(\text{nth}(p', i), \text{nth}(p', 1 + i)) \\ \{-4\} \quad n' \leq \text{length}(p') \\ \{-5\} \quad \text{length}(p') - n' \geq 1 \end{array}}{\{1\} \quad \forall (i: \text{below}(\text{length}(\text{tail}(p', n')))): g' \text{'nodes}(\text{nth}(\text{tail}(p', n'), i))}$$

Repeatedly Skolemizing and flattening,

Simplifying, rewriting, and recording with decision procedures,

Instantiating quantified variables,

This completes the proof of path_tail.1.

path_tail.2:

$$\frac{\begin{array}{l} \{-1\} \quad \text{path_list?}[T](p') \\ \{-2\} \quad \forall (i: \text{below}(\text{length}(p'))): g' \text{'nodes}(\text{nth}(p', i)) \\ \{-3\} \quad \forall (i: \text{below}(\text{length}(p') - 1)): g' \text{'edges}(\text{nth}(p', i), \text{nth}(p', 1 + i)) \\ \{-4\} \quad n' \leq \text{length}(p') \\ \{-5\} \quad \text{length}(p') - n' \geq 1 \end{array}}{\{1\} \quad \forall (i: \text{below}(\text{length}(\text{tail}(p', n') - 1)): \\ g' \text{'edges}(\text{nth}(\text{tail}(p', n'), i), \text{nth}(\text{tail}(p', n'), 1 + i))}$$

Repeatedly Skolemizing and flattening,

Simplifying, rewriting, and recording with decision procedures,

Instantiating quantified variables,

Simplifying, rewriting, and recording with decision procedures,

This completes the proof of path_tail.2.

Q.E.D.

C.97.11 Graph.path_cdr_TCC1

Terse proof for path_cdr_TCC1.

path_cdr_TCC1:

$$\frac{}{\{1\} \quad \forall (g: \text{graph_type}, p: (\text{path?}(g))): \text{cons?}[T](p)}$$

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of path_cdr_TCC1.

Q.E.D.

C.97.12 Graph.path_cdr

Terse proof for path_cdr.

path_cdr:

$$\{1\} \quad \forall (g: \text{graph_type}, p: (\text{path?}(g))):$$

$$\text{path_list?}[T](\text{cdr}(p)) \supset \text{path?}(g)(\text{cdr}(p))$$

Repeatedly Skolemizing and flattening,
 Expanding the definition of path_list?,
 Installing automatic rewrites from: length_cdr tail
 Simplifying, rewriting, and recording with decision procedures,
 Using lemma path_tail,
 Simplifying, rewriting, and recording with decision procedures,
 This completes the proof of path_cdr.
 Q.E.D.

C.97.13 Graph.path_concat_path

Terse proof for path_concat_path.

path_concat_path:

$$\{1\} \quad \forall (g: \text{graph_type}, p_1, p_2: (\text{path?}(g))):$$

$$\text{concatable?}(p_1, p_2) \supset \text{path?}(g)(\text{concat_path}(p_1, p_2))$$

Repeatedly Skolemizing and flattening,
 Installing automatic rewrites from: path_list? path? nth_append_left nth_append_right
 length_append length_cdr length_concat_path concat_path
 Simplifying, rewriting, and recording with decision procedures,
 Applying disjunctive simplification to flatten sequent,
 Applying propositional simplification,
 we get 2 subgoals:

path_concat_path.1:

$$\{-1\} \quad \text{length}(p'_1) \geq 1$$

$$\{-2\} \quad \forall (i: \text{below}(\text{length}(p'_1))): g' \text{'nodes}(\text{nth}(p'_1, i))$$

$$\{-3\} \quad \forall (i: \text{below}(\text{length}(p'_1) - 1)):$$

$$g' \text{'edges}(\text{nth}(p'_1, i), \text{nth}(p'_1, 1 + i))$$

$$\{-4\} \quad \text{length}(p'_2) \geq 1$$

$$\{-5\} \quad \forall (i: \text{below}(\text{length}(p'_2))): g' \text{'nodes}(\text{nth}(p'_2, i))$$

$$\{-6\} \quad \forall (i: \text{below}(\text{length}(p'_2) - 1)):$$

$$g' \text{'edges}(\text{nth}(p'_2, i), \text{nth}(p'_2, 1 + i))$$

$$\{-7\} \quad \text{concatable?}(p'_1, p'_2)$$

$$\{1\} \quad \forall (i: \text{below}(\text{length}(\text{append}(p'_1, \text{cdr}(p'_2))))):$$

$$g' \text{'nodes}(\text{nth}(\text{append}(p'_1, \text{cdr}(p'_2)), i))$$

Hiding formulas: -3, -6,
 Repeatedly Skolemizing and flattening,
 Simplifying, rewriting, and recording with decision procedures,
 Case splitting on $i!1 < \text{length}(p!1)$,
 we get 2 subgoals:

path_concat_path.1.1:

{-1}	$i' < \text{length}(p'_1)$
{-2}	$i' < \text{length}(p'_1) + \text{length}(p'_2) - 1$
{-3}	$\text{length}(p'_1) \geq 1$
{-4}	$\forall (i : \text{below}(\text{length}(p'_1))): g' \text{ nodes}(\text{nth}(p'_1, i))$
{-5}	$\text{length}(p'_2) \geq 1$
{-6}	$\forall (i : \text{below}(\text{length}(p'_2))): g' \text{ nodes}(\text{nth}(p'_2, i))$
{-7}	$\text{concatable?}(p'_1, p'_2)$
{1}	
$g' \text{ nodes}(\text{nth}(\text{append}(p'_1, \text{cdr}(p'_2)), i'))$	

Simplifying, rewriting, and recording with decision procedures,

Instantiating quantified variables,

This completes the proof of path_concat_path.1.1.

path_concat_path.1.2:

{-1}	$i' < \text{length}(p'_1) + \text{length}(p'_2) - 1$
{-2}	$\text{length}(p'_1) \geq 1$
{-3}	$\forall (i : \text{below}(\text{length}(p'_1))): g' \text{ nodes}(\text{nth}(p'_1, i))$
{-4}	$\text{length}(p'_2) \geq 1$
{-5}	$\forall (i : \text{below}(\text{length}(p'_2))): g' \text{ nodes}(\text{nth}(p'_2, i))$
{-6}	$\text{concatable?}(p'_1, p'_2)$
{1}	
$i' < \text{length}(p'_1)$	
{2}	
$g' \text{ nodes}(\text{nth}(\text{append}(p'_1, \text{cdr}(p'_2)), i'))$	

Simplifying, rewriting, and recording with decision procedures,

Instantiating the top quantifier in -5 with the terms: $i' - \text{length}(p'_1) + 1$,

Expanding the definition of nth,

which is trivially true.

This completes the proof of path_concat_path.1.2.

path_concat_path.2:

{-1}	$\text{length}(p'_1) \geq 1$
{-2}	$\forall (i : \text{below}(\text{length}(p'_1))): g' \text{ nodes}(\text{nth}(p'_1, i))$
{-3}	$\forall (i : \text{below}(\text{length}(p'_1) - 1)):$ $g' \text{ edges}(\text{nth}(p'_1, i), \text{nth}(p'_1, 1 + i))$
{-4}	$\text{length}(p'_2) \geq 1$
{-5}	$\forall (i : \text{below}(\text{length}(p'_2))): g' \text{ nodes}(\text{nth}(p'_2, i))$
{-6}	$\forall (i : \text{below}(\text{length}(p'_2) - 1)):$ $g' \text{ edges}(\text{nth}(p'_2, i), \text{nth}(p'_2, 1 + i))$
{-7}	$\text{concatable?}(p'_1, p'_2)$
{1}	
$\forall (i : \text{below}(\text{length}(\text{append}(p'_1, \text{cdr}(p'_2))) - 1)):$ $g' \text{ edges}$ $(\text{nth}(\text{append}(p'_1, \text{cdr}(p'_2)), i), \text{nth}(\text{append}(p'_1, \text{cdr}(p'_2)), 1 + i))$	

Repeatedly Skolemizing and flattening,

Simplifying, rewriting, and recording with decision procedures,

Case splitting on $1 + i!1 < \text{length}(p1!1)$,

we get 2 subgoals:

path_concat_path.2.1:

{-1}	$1 + i' < \text{length}(p'_1)$
{-2}	$i' < \text{length}(p'_1) + \text{length}(p'_2) - 2$
{-3}	$\text{length}(p'_1) \geq 1$
{-4}	$\forall (i: \text{below}(\text{length}(p'_1))): g' \text{ nodes}(\text{nth}(p'_1, i))$
{-5}	$\forall (i: \text{below}(\text{length}(p'_1) - 1)):$ $g' \text{ edges}(\text{nth}(p'_1, i), \text{nth}(p'_1, 1 + i))$
{-6}	$\text{length}(p'_2) \geq 1$
{-7}	$\forall (i: \text{below}(\text{length}(p'_2))): g' \text{ nodes}(\text{nth}(p'_2, i))$

 $\text{tail} = p_2))$
 \supset
 $\text{path?}(g')(\text{cons}(t, \text{tail})) \supset$
 $(\forall (p_2: (\text{path?}(g'))):$
 $\text{tree?}(g') \wedge$
 $\text{path_end}(\text{cons}(t, \text{tail})) = \text{path_end}(p_2) \wedge$
 $\text{length}(\text{cons}(t, \text{tail})) = \text{length}(p_2)$
 $\supset \text{cons}(t, \text{tail}) = p_2)$

Repeatedly Skolemizing and flattening,
 Using lemma `path_cdr`,
 Simplifying, rewriting, and recording with decision procedures,

C Proof scripts

Expanding the definition of length,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Instantiating the top quantifier in -5 with the terms: $\text{cdr}(p'_2)$,

we get 2 subgoals:

tree_path.3.1:

{-1}	$\text{path?}(g')(\text{tail}')$
{-2}	$\text{path_list?}[T](p'_2)$
{-3}	$\text{path?}(g')(p'_2)$
{-4}	$\text{path_list?}(\text{tail}')$
{-5}	$\text{path_end}(\text{tail}') = \text{path_end}(\text{cdr}(p'_2)) \wedge \text{length}(\text{tail}') = \text{length}(\text{cdr}(p'_2)) \supset$ $\text{tail}' = \text{cdr}(p'_2)$
{-6}	$\text{path?}(g')(\text{cons}(t', \text{tail}'))$
{-7}	$\text{tree?}(g')$
{-8}	$\text{path_end}(\text{cons}(t', \text{tail}')) = \text{path_end}(p'_2)$
{-9}	$\text{length}(\text{tail}') = \text{length}(\text{cdr}(p'_2))$
{1}	$\text{null?}(p'_2)$
{2}	$\text{cons}(t', \text{tail}') = p'_2$

Expanding the definition of path_list?,

Applying propositional simplification,

we get 2 subgoals:

tree_path.3.1.1:

{-1}	$\text{tail}' = \text{cdr}(p'_2)$
{-2}	$\text{path?}(g')(\text{tail}')$
{-3}	$\text{length}(p'_2) \geq 1$
{-4}	$\text{path?}(g')(p'_2)$
{-5}	$\text{length}(\text{tail}') \geq 1$
{-6}	$\text{path?}(g')(\text{cons}(t', \text{tail}'))$
{-7}	$\text{tree?}(g')$
{-8}	$\text{path_end}(\text{cons}(t', \text{tail}')) = \text{path_end}(p'_2)$
{-9}	$\text{length}(\text{tail}') = \text{length}(\text{cdr}(p'_2))$
{1}	$\text{null?}(p'_2)$
{2}	$\text{cons}(t', \text{tail}') = p'_2$

Applying extensionality,

Hiding formulas: -2,

Expanding the definition of path?,

Applying disjunctive simplification to flatten sequent,

Instantiating the top quantifier in -4 with the terms: 0,

we get 2 subgoals:

tree_path.3.1.1.1.1:

{-1}	tail' = cdr(p ₂)
{-2}	length(p ₂) ≥ 1
{-3}	∀ (i: below(length(p ₂))): g' nodes(nth(p ₂ , i))
{-4}	g' edges(nth(p ₂ , 0), nth(p ₂ , 1 + 0))
{-5}	length(tail') ≥ 1
{-6}	∀ (i: below(length(cons(t', tail')))): g' nodes(nth(cons(t', tail'), i))
{-7}	∀ (i: below(length(cons(t', tail')) - 1)): g' edges(nth(cons(t', tail'), i), nth(cons(t', tail'), 1 + i))
{-8}	tree?(g')
{-9}	path_end(cons(t', tail')) = path_end(p ₂)
{-10}	length(tail') = length(cdr(p ₂))
{1}	t' = car(p ₂)
{2}	null?(p ₂)

Instantiating the top quantifier in -7 with the terms: 0,
we get 2 subgoals:

tree_path.3.1.1.1.1.1:

{-1}	tail' = cdr(p ₂)
{-2}	length(p ₂) ≥ 1
{-3}	∀ (i: below(length(p ₂))): g' nodes(nth(p ₂ , i))
{-4}	g' edges(nth(p ₂ , 0), nth(p ₂ , 1 + 0))
{-5}	length(tail') ≥ 1
{-6}	∀ (i: below(length(cons(t', tail')))): g' nodes(nth(cons(t', tail'), i))
{-7}	g' edges(nth(cons(t', tail'), 0), nth(cons(t', tail'), 1 + 0))
{-8}	tree?(g')
{-9}	path_end(cons(t', tail')) = path_end(p ₂)
{-10}	length(tail') = length(cdr(p ₂))
{1}	t' = car(p ₂)
{2}	null?(p ₂)

Installing automatic rewrites from: nth
Simplifying, rewriting, and recording with decision procedures,
Expanding the definition of tree?,
Applying disjunctive simplification to flatten sequent,
Instantiating the top quantifier in -9 with the terms: t', car(p₂), car(tail'),
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of tree_path.3.1.1.1.1.

tree_path.3.1.1.1.1.2:

{-1}	tail' = cdr(p ₂)
{-2}	length(p ₂) ≥ 1
{-3}	∀ (i: below(length(p ₂))): g' nodes(nth(p ₂ , i))
{-4}	g' edges(nth(p ₂ , 0), nth(p ₂ , 1 + 0))
{-5}	length(tail') ≥ 1
{-6}	∀ (i: below(length(cons(t', tail')))): g' nodes(nth(cons(t', tail'), i))

{2}	$\text{null?}(p'_2)$
{3}	$\text{cons}(t', \text{tail}') = p'_2$

Using lemma `path_cdr`,
Expanding the definition of `path_list?`,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 This completes the proof of `tree_path.3.2`.
 Q.E.D.

C.97.18 Graph.root_path_TCC1

Terse proof for `root_path_TCC1`.

`root_path_TCC1`:

{1} $\forall (g: \text{graph_type}, n: (g' \text{nodes}), p: (\text{path?}(g))): (g' \text{nodes})(\text{path_start}[T](p))$

Repeatedly Skolemizing and flattening,
 Rewriting using `nodes_path_start`, matching in *,
 This completes the proof of `root_path_TCC1`.
 Q.E.D.

C.97.19 Graph.path_length_bound_TCC1

Terse proof for `path_length_bound_TCC1`.

`path_length_bound_TCC1`:

{1} $\forall (g: \text{graph_type}):$
 $\text{cycle_free?}(g) \wedge \text{finite?}(g) \supset (\forall (p: (\text{path?}(g))): \text{is_finite}[T](g' \text{nodes}))$

Repeatedly Skolemizing and flattening,
 Expanding the definition of `finite?`,
 which is trivially true.
 This completes the proof of `path_length_bound_TCC1`.
 Q.E.D.

C.97.20 Graph.path_length_bound

Terse proof for `path_length_bound`.

`path_length_bound`:

{1} $\forall (g: \text{graph_type}):$
 $\text{finite?}(g) \wedge \text{cycle_free?}(g) \supset$
 $(\forall (p: (\text{path?}(g))): \text{length}(p) \leq \text{card}(g' \text{nodes}))$

Repeatedly Skolemizing and flattening,
 Using lemma `list_pred_card[T]`,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 we get 3 subgoals:

`path_length_bound.1`:

{-1} $\exists (n_1, n_2: \text{below}(\text{length}(p'))): \neg n_1 = n_2 \wedge \text{nth}(p', n_1) = \text{nth}(p', n_2)$
 {-2} $\text{path_list?}[T](p')$
 {-3} $\text{path?}(g')(p')$
 {-4} $\text{finite?}(g')$
 {-5} $\text{cycle_free?}(g')$

 {1} $\text{length}(p') \leq \text{card}(g' \text{nodes})$

C Proof scripts

Repeatedly Skolemizing and flattening,
 Using lemma `path_cycle_free`,
 Simplifying, rewriting, and recording with decision procedures,
 Instantiating quantified variables,
 Simplifying, rewriting, and recording with decision procedures,
 This completes the proof of `path_length_bound.1`.

`path_length_bound.2`:

{-1}	<code>path_list?[T](p')</code>
{-2}	<code>path?(g')(p')</code>
{-3}	<code>finite?(g')</code>
{-4}	<code>cycle_free?(g')</code>
{1}	<code>every(g'nodes)(p')</code>
{2}	<code>length(p') ≤ card(g'nodes)</code>

Rewriting using `every_nth`, matching in `*`,
 Expanding the definition of `path?`,
 Applying disjunctive simplification to flatten sequent,
 This completes the proof of `path_length_bound.2`.

`path_length_bound.3`:

{-1}	<code>path_list?[T](p')</code>
{-2}	<code>path?(g')(p')</code>
{-3}	<code>finite?(g')</code>
{-4}	<code>cycle_free?(g')</code>

Expanding the definition of `finite?`,
 which is trivially true.
 This completes the proof of `path_length_bound.3`.
 Q.E.D.

C.97.21 Graph.non_root_path

Terse proof for `non_root_path`.

`non_root_path`:

{1}	$\forall (g: \text{graph_type}, n: (g'nodes)):$ $\text{roots}(g)(n) \vee (\exists (p: (\text{path?}(g))): \text{length}(p) = 2 \wedge \text{path_end}(p) = n)$

Repeatedly Skolemizing and flattening,
 Expanding the definition of `roots`,
 Repeatedly Skolemizing and flattening,
 Case splitting on `length[T]((: x!1, n!1 :)) = 2`,
 we get 2 subgoals:

`non_root_path.1`:

{-1}	<code>length[T]((:x', n':)) = 2</code>
{-2}	<code>g'nodes(x')</code>
{-3}	<code>g'nodes(n')</code>
{-4}	<code>g'edges(x', n')</code>
{1}	$\exists (p: (\text{path?}(g'))): \text{length}(p) = 2 \wedge \text{path_end}(p) = n'$

Instantiating the top quantifier in 1 with the terms: `(:x', n':)`,

we get 2 subgoals:

non_root_path.1.1:

$$\left| \begin{array}{l} \{-1\} \text{ length}[T]((:x', n':)) = 2 \\ \{-2\} g' \text{ nodes}(x') \\ \{-3\} g' \text{ nodes}(n') \\ \{-4\} g' \text{ edges}(x', n') \end{array} \right. \hline \{1\} \text{ length}((:x', n':)) = 2 \wedge \text{ path_end}((:x', n':)) = n'$$

Simplifying, rewriting, and recording with decision procedures,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of **non_root_path.1.1**.

non_root_path.1.2:

$$\left| \begin{array}{l} \{-1\} \text{ length}[T]((:x', n':)) = 2 \\ \{-2\} g' \text{ nodes}(x') \\ \{-3\} g' \text{ nodes}(n') \\ \{-4\} g' \text{ edges}(x', n') \end{array} \right. \hline \{1\} \text{ path_list?}[T]((:x', n':)) \wedge \text{ path?}(g')((:x', n':))$$

Expanding the definition of `path_list?`,

Simplifying, rewriting, and recording with decision procedures,

Expanding the definition of `path?`,

Applying propositional simplification,

we get 2 subgoals:

non_root_path.1.2.1:

$$\left| \begin{array}{l} \{-1\} \text{ length}[T]((:x', n':)) = 2 \\ \{-2\} g' \text{ nodes}(x') \\ \{-3\} g' \text{ nodes}(n') \\ \{-4\} g' \text{ edges}(x', n') \end{array} \right. \hline \{1\} \forall (i: \text{ below}(\text{length}((:x', n':)))): g' \text{ nodes}(\text{nth}((:x', n':), i))$$

Repeatedly Skolemizing and flattening,

Case splitting on `i!1 = 0`,

we get 2 subgoals:

non_root_path.1.2.1.1:

$$\left| \begin{array}{l} \{-1\} i' = 0 \\ \{-2\} i' < \text{ length}((:x', n':)) \\ \{-3\} \text{ length}[T]((:x', n':)) = 2 \\ \{-4\} g' \text{ nodes}(x') \\ \{-5\} g' \text{ nodes}(n') \\ \{-6\} g' \text{ edges}(x', n') \end{array} \right. \hline \{1\} g' \text{ nodes}(\text{nth}((:x', n':), i'))$$

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of **non_root_path.1.2.1.1**.

Q.E.D.

C.97.26 Graph.root_path_singleton

Terse proof for root_path_singleton.

root_path_singleton:

	{1} $\forall (g: \text{graph_type}, n: (g' \text{ nodes})): \text{finite_tree?}(g) \supset \text{singleton?}(\text{root_path}(g, n))$
--	--

Repeatedly Skolemizing and flattening,
Expanding the definition of singleton?,
Using lemma tree_path_to_root,
Simplifying, rewriting, and recording with decision procedures,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Repeatedly Skolemizing and flattening,

Using lemma `tree_unique_path_to_root`,
 Simplifying, rewriting, and recording with decision procedures,
 Expanding the definition of `finite_tree?`,
 which is trivially true.
 This completes the proof of `root_path_singleton`.
 Q.E.D.

C.97.27 Graph.path_to_root_TCC1

Terse proof for `path_to_root_TCC1`.

`path_to_root_TCC1`:

$$\{1\} \quad \forall (g: (\text{finite_tree?}), n: (g' \text{nodes})): \\ \text{singleton?}[(\text{path?}(g))](\text{root_path}(g, n))$$

Repeatedly Skolemizing and flattening,
 Rewriting using `root_path_singleton`, matching in *,
 This completes the proof of `path_to_root_TCC1`.
 Q.E.D.

C.97.28 Graph.path_factor_TCC1

Terse proof for `path_factor_TCC1`.

`path_factor_TCC1`:

$$\{1\} \quad \forall (g: \text{graph_type}, p_1, p_2: (\text{path?}(g))): \\ (\text{path_start}(p_1) = \text{path_start}(p_2) \wedge \\ (\exists (n: \text{nat}): \\ n < \text{length}(p_1) \wedge n < \text{length}(p_2) \wedge \neg \text{nth}(p_1, n) = \text{nth}(p_2, n))) \\ \supset \\ (\forall (q, p1t, p2t: (\text{path?}(g))): \\ p_2 = \text{concat_path}(q, p2t) \wedge \\ p_1 = \text{concat_path}(q, p1t) \wedge \\ \text{length}(p2t) \geq 2 \wedge \\ \text{length}(p1t) \geq 2 \wedge \text{concatable?}(q, p2t) \wedge \text{concatable?}(q, p1t) \\ \supset 0 < \text{length}[T](p1t))$$

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of `path_factor_TCC1`.
 Q.E.D.

C.97.29 Graph.path_factor_TCC2

Terse proof for `path_factor_TCC2`.

path_factor_TCC2:

$$\begin{array}{l}
 \{1\} \quad \forall (g: \text{graph_type}, p_1, p_2: (\text{path?}(g))): \\
 \quad (\text{path_start}(p_1) = \text{path_start}(p_2) \wedge \\
 \quad \quad (\exists (n: \text{nat}): \\
 \quad \quad \quad n < \text{length}(p_1) \wedge n < \text{length}(p_2) \wedge \neg \text{nth}(p_1, n) = \text{nth}(p_2, n))) \\
 \quad \supset \\
 \quad (\forall (q, p1t, p2t: (\text{path?}(g))): \\
 \quad \quad p_2 = \text{concat_path}(q, p2t) \wedge \\
 \quad \quad p_1 = \text{concat_path}(q, p1t) \wedge \\
 \quad \quad \text{length}(p2t) \geq 2 \wedge \\
 \quad \quad \text{length}(p1t) \geq 2 \wedge \text{concatable?}(q, p2t) \wedge \text{concatable?}(q, p1t) \\
 \quad \quad \supset 0 < \text{length}^{[T]}(p2t))
 \end{array}$$

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of path_factor_TCC2.

Q.E.D.

C.97.30 Graph.path_factor_TCC3

Terse proof for path_factor_TCC3.

path_factor_TCC3:

$$\begin{array}{l}
 \{1\} \quad \forall (g: \text{graph_type}, p_1, p_2: (\text{path?}(g))): \\
 \quad (\text{path_start}(p_1) = \text{path_start}(p_2) \wedge \\
 \quad \quad (\exists (n: \text{nat}): \\
 \quad \quad \quad n < \text{length}(p_1) \wedge n < \text{length}(p_2) \wedge \neg \text{nth}(p_1, n) = \text{nth}(p_2, n))) \\
 \quad \supset \\
 \quad (\forall (q, p1t, p2t: (\text{path?}(g))): \\
 \quad \quad \text{nth}(p1t, 0) = \text{nth}(p2t, 0) \wedge \\
 \quad \quad p_2 = \text{concat_path}(q, p2t) \wedge \\
 \quad \quad p_1 = \text{concat_path}(q, p1t) \wedge \\
 \quad \quad \text{length}(p2t) \geq 2 \wedge \\
 \quad \quad \text{length}(p1t) \geq 2 \wedge \text{concatable?}(q, p2t) \wedge \text{concatable?}(q, p1t) \\
 \quad \quad \supset 1 < \text{length}^{[T]}(p1t))
 \end{array}$$

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of path_factor_TCC3.

Q.E.D.

C.97.31 Graph.path_factor_TCC4

Terse proof for path_factor_TCC4.

path_factor_TCC4:

```

{1}  ∀ (g: graph_type, p1, p2: (path?(g))):
      (path_start(p1) = path_start(p2) ∧
       (∃ (n: nat):
          n < length(p1) ∧ n < length(p2) ∧ ¬ nth(p1, n) = nth(p2, n)))
      ⊃
      (∀ (q, p1t, p2t: (path?(g))):
         nth(p1t, 0) = nth(p2t, 0) ∧
         p2 = concat_path(q, p2t) ∧
         p1 = concat_path(q, p1t) ∧
         length(p2t) ≥ 2 ∧
         length(p1t) ≥ 2 ∧ concatable?(q, p2t) ∧ concatable?(q, p1t)
         ⊃ 1 < length[T](p2t))

```

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of path_factor_TCC4.

Q.E.D.

C.97.32 Graph.path_factor

Terse proof for path_factor.

path_factor:

```

{1}  ∀ (g: graph_type, p1, p2: (path?(g))):
      (path_start(p1) = path_start(p2) ∧
       (∃ (n: nat):
          n < length(p1) ∧ n < length(p2) ∧ ¬ nth(p1, n) = nth(p2, n)))
      ⊃
      (∃ (q, p1t, p2t: (path?(g))):
         concatable?(q, p1t) ∧
         concatable?(q, p2t) ∧
         length(p1t) ≥ 2 ∧
         length(p2t) ≥ 2 ∧
         p1 = concat_path(q, p1t) ∧
         p2 = concat_path(q, p2t) ∧
         nth(p1t, 0) = nth(p2t, 0) ∧ ¬ nth(p1t, 1) = nth(p2t, 1))

```

Repeatedly Skolemizing and flattening,

Installing automatic rewrites from: concatable? concat_path head_tail path_list? length_head length_tail path_end path_start nth_tail car_tail cdr_tail path_tail path_head nth_head

Simplifying, rewriting, and recording with decision procedures,

Letting nd name min(LAMBDA (i: nat): i < length(p1!1) AND i < length(p2!1) AND NOT nth(p1!1, i) = nth(p2!1, i)),

we get 2 subgoals:

C Proof scripts

path_factor.1:

{-1}	$\min(\lambda (i: \text{nat}):$
	$i < \text{length}(p'_1) \wedge i < \text{length}(p'_2) \wedge \neg \text{nth}(p'_1, i) = \text{nth}(p'_2, i))$
	$= \text{nd}$
{-2}	$n' \geq 0$
{-3}	$\text{length}(p'_1) \geq 1$
{-4}	$\text{path?}(g')(p'_1)$
{-5}	$\text{length}(p'_2) \geq 1$
{-6}	$\text{path?}(g')(p'_2)$
{-7}	$\text{car}(p'_1) = \text{car}(p'_2)$
{-8}	$n' < \text{length}(p'_1)$
{-9}	$n' < \text{length}(p'_2)$
{1}	$\text{nth}(p'_1, n') = \text{nth}(p'_2, n')$

        ⊃ P(n1, n2)))
      ⊃ (∀ (n1, n2: (g'nodes)): P(n1, n2))

```

Skolemizing and flattening,
 Using lemma `node_pair_distinction`,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 Hiding formulas: -2, -4, -5, 2,
 Repeatedly Skolemizing and flattening,
 Instantiating the top quantifier in -6 with the terms: n'_2, n'_1, p' ,
 Simplifying, rewriting, and recording with decision procedures,
 Expanding the definition of `symmetric?`,
 Instantiating the top quantifier in -10 with the terms: n'_2, n'_1 ,
 Simplifying, rewriting, and recording with decision procedures,
 This completes the proof of `symmetric_node_pair_distinction`.
 Q.E.D.

C.98 Proofs for Graph_Relations (graph.pvs)

C.98.1 Graph_Relations.trans_closure_char_TCC1

Terse proof for `trans_closure_char_TCC1`.

`trans_closure_char_TCC1`:

$$\{1\} \quad \forall (x, y: T, l: \text{list}[T]): \text{length}(l) \geq 2 \supset \text{path_list?}[T](l)$$

Repeatedly Skolemizing and flattening,
 Installing automatic rewrites from: `path_list? length`
 Simplifying, rewriting, and recording with decision procedures,
 This completes the proof of `trans_closure_char_TCC1`.
 Q.E.D.

C.98.2 Graph_Relations.trans_closure_char_TCC2

Terse proof for `trans_closure_char_TCC2`.

`trans_closure_char_TCC2`:

$$\{1\} \quad \forall (x, y: T, l: \text{list}[T]):$$

$$\text{path_end}(l) = y \wedge \text{path_start}(l) = x \wedge \text{length}(l) \geq 2 \supset$$

$$(\forall (i: \text{below}(\text{length}[T](l) - 1)): i < \text{length}[T](l))$$

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of `trans_closure_char_TCC2`.
 Q.E.D.

C.98.3 Graph_Relations.trans_closure_char_TCC3

Terse proof for `trans_closure_char_TCC3`.

`trans_closure_char_TCC3`:

$$\{1\} \quad \forall (x, y: T, l: \text{list}[T]):$$

$$\text{path_end}(l) = y \wedge \text{path_start}(l) = x \wedge \text{length}(l) \geq 2 \supset$$

$$(\forall (i: \text{below}(\text{length}[T](l) - 1)): i + 1 < \text{length}[T](l))$$

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `trans_closure_char_TCC3`.

Q.E.D.

C.98.4 Graph_Relations.trans_closure_char

Terse proof for `trans_closure_char`.

`trans_closure_char`:

{1}	$\forall (R: \text{PRED}[[T, T]], x, y: T):$ $\text{transitive_closure}(R)(x, y) \equiv$ $(\exists (l: \text{list}[T]):$ $\text{length}(l) \geq 2 \wedge$ $\text{path_start}(l) = x \wedge$ $\text{path_end}(l) = y \wedge$ $(\forall (i: \text{below}(\text{length}(l) - 1)):$ $R(\text{nth}(l, i), \text{nth}(l, i + 1))))$
-----	--

Installing automatic rewrites from: `path_list?` `length` `length_is_cons` `length_cdr`

Repeatedly Skolemizing and flattening,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 2 subgoals:

`trans_closure_char.1`:

{-1}	$\text{transitive_closure}(R')(x', y')$
{1}	$\exists (l: \text{list}[T]):$ $\text{length}(l) \geq 2 \wedge$ $\text{path_start}(l) = x' \wedge$ $\text{path_end}(l) = y' \wedge$ $(\forall (i: \text{below}(\text{length}(l) - 1)): R'(\text{nth}(l, i), \text{nth}(l, 1 + i)))$

Expanding the definition of `transitive_closure`,

Instantiating the top quantifier in -1 with the terms: $\lambda (x, y: T): \exists (l: \text{list}[T]): \text{length}(l) \geq 2 \wedge \text{path_start}(l) = x \wedge \text{path_end}(l) = y \wedge (\forall (i: \text{below}(\text{length}(l) - 1)): R'(\text{nth}(l, i), \text{nth}(l, 1 + i)))$,

we get 3 subgoals:

`trans_closure_char.1.1:`

$$\begin{array}{l}
 \{ -1 \} \quad (R' \subseteq \lambda (x, y : T) : \exists (l : \text{list}[T]) : \text{length}(l) \geq 2 \wedge \text{path_start}(l) = x \wedge \text{path_end}(l) = \\
 \quad \wedge \\
 \quad \text{transitive?}(\lambda (x, y : T) : \\
 \quad \quad \exists (l : \text{list}[T]) : \\
 \quad \quad \quad \text{length}(l) \geq 2 \wedge \\
 \quad \quad \quad \text{path_start}(l) = x \wedge \\
 \quad \quad \quad \text{path_end}(l) = y \wedge \\
 \quad \quad \quad (\forall (i : \text{below}(\text{length}(l) - 1)) : \\
 \quad \quad \quad \quad R'(\text{nth}(l, i), \text{nth}(l, 1 + i)))) \\
 \quad \supset \\
 \quad (\exists (l : \text{list}[T]) : \\
 \quad \quad \text{length}(l) \geq 2 \wedge \\
 \quad \quad \text{path_start}(l) = x' \wedge \\
 \quad \quad \text{path_end}(l) = y' \wedge \\
 \quad \quad (\forall (i : \text{below}(\text{length}(l) - 1)) : \\
 \quad \quad \quad R'(\text{nth}(l, i), \text{nth}(l, 1 + i)))) \\
 \hline
 \{ 1 \} \quad \exists (l : \text{list}[T]) : \\
 \quad \text{length}(l) \geq 2 \wedge \\
 \quad \text{path_start}(l) = x' \wedge \\
 \quad \text{path_end}(l) = y' \wedge \\
 \quad (\forall (i : \text{below}(\text{length}(l) - 1)) : R'(\text{nth}(l, i), \text{nth}(l, 1 + i)))
 \end{array}$$

Applying propositional simplification,

we get 2 subgoals:

`trans_closure_char.1.1.1:`

$$\begin{array}{l}
 \{ 1 \} \quad (R' \subseteq \lambda (x, y : T) : \exists (l : \text{list}[T]) : \text{length}(l) \geq 2 \wedge \text{path_start}(l) = x \wedge \text{path_end}(l) = \\
 \{ 2 \} \quad \exists (l : \text{list}[T]) : \\
 \quad \text{length}(l) \geq 2 \wedge \\
 \quad \text{path_start}(l) = x' \wedge \\
 \quad \text{path_end}(l) = y' \wedge \\
 \quad (\forall (i : \text{below}(\text{length}(l) - 1)) : R'(\text{nth}(l, i), \text{nth}(l, 1 + i)))
 \end{array}$$

Hiding formulas: 2,

Expanding the definition(s) of (subset? member),

Repeatedly Skolemizing and flattening,

Instantiating the top quantifier in 1 with the terms: (x''^1 , x''^2),

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `trans_closure_char.1.1.1`.

trans_closure_char.1.1.2:

{1}	$\text{transitive?}(\lambda (x, y: T):$ $\quad \exists (l: \text{list}[T]):$ $\quad \text{length}(l) \geq 2 \wedge$ $\quad \text{path_start}(l) = x \wedge$ $\quad \text{path_end}(l) = y \wedge$ $\quad (\forall (i: \text{below}(\text{length}(l) - 1)): \\ \quad \quad R'(\text{nth}(l, i), \text{nth}(l, 1 + i))))$
{2}	$\exists (l: \text{list}[T]):$ $\text{length}(l) \geq 2 \wedge$ $\text{path_start}(l) = x' \wedge$ $\text{path_end}(l) = y' \wedge$ $(\forall (i: \text{below}(\text{length}(l) - 1)): R'(\text{nth}(l, i), \text{nth}(l, 1 + i)))$

Hiding formulas: 2,

Expanding the definition of transitive?,

Repeatedly Skolemizing and flattening,

Installing automatic rewrites from: length_append nth_append_right nth_append_left

Simplifying, rewriting, and recording with decision procedures,

Instantiating the top quantifier in 1 with the terms: append(l' , cdr(l'')),

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 3 subgoals:

trans_closure_char.1.1.2.1:

{-1}	$\text{length}(l') \geq 2$

we get 2 subgoals:

trans_closure_char.2.1:

$\{-1\} \quad \forall (x, y: T, l: (\text{path_list?}[T])):$ $\quad \text{length}(l) \geq 2 \wedge$ $\quad \text{path_start}(l) = x \wedge$ $\quad \text{path_end}(l) = y \wedge$ $\quad (\forall (i: \text{below}(\text{length}(l) - 1)):$ $\quad \quad R'(\text{nth}(l, i), \text{nth}(l, 1 + i)))$ $\quad \supset \text{transitive_closure}(R')(x, y)$	$\{-2\} \quad \exists (l: \text{list}[T]):$ $\quad \text{length}(l) \geq 2 \wedge$ $\quad \text{path_start}(l) = x' \wedge$ $\quad \text{path_end}(l) = y' \wedge$ $\quad (\forall (i: \text{below}(\text{length}(l) - 1))): R'(\text{nth}(l, i), \text{nth}(l, 1 + i)))$
$\{1\} \quad \text{transitive_closure}(R')(x', y')$	

Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of trans_closure_char.2.1.

trans_closure_char.2.2:

$\{-1\} \quad \exists (l: \text{list}[T]):$ $\quad \text{length}(l) \geq 2 \wedge$ $\quad \text{path_start}(l) = x' \wedge$ $\quad \text{path_end}(l) = y' \wedge$ $\quad (\forall (i: \text{below}(\text{length}(l) - 1))): R'(\text{nth}(l, i), \text{nth}(l, 1 + i)))$	
$\{1\} \quad \forall (x, y: T, l: (\text{path_list?}[T])):$ $\quad \text{length}(l) \geq 2 \wedge$ $\quad \text{path_start}(l) = x \wedge$ $\quad \text{path_end}(l) = y \wedge$ $\quad (\forall (i: \text{below}(\text{length}(l) - 1)):$ $\quad \quad R'(\text{nth}(l, i), \text{nth}(l, 1 + i)))$ $\quad \supset \text{transitive_closure}(R')(x, y)$	$\{2\} \quad \text{transitive_closure}(R')(x', y')$

Hiding formulas: -1, 2,
Inducting on l on formula 1 using induction scheme path_list_induction[T],
we get 2 subgoals:

trans_closure_char.2.2.1:

$\{1\} \quad \forall (t: T):$ $\quad \forall (x, y: T):$ $\quad (\text{length}(\text{cons}(t, \text{null})) \geq 2 \wedge$ $\quad \text{path_start}(\text{cons}(t, \text{null})) = x \wedge$ $\quad \text{path_end}(\text{cons}(t, \text{null})) = y \wedge$ $\quad (\forall (i: \text{below}(\text{length}(\text{cons}(t, \text{null})) - 1)):$ $\quad \quad R'(\text{nth}(\text{cons}(t, \text{null}), i), \text{nth}(\text{cons}(t, \text{null}), 1 + i))))$ $\quad \supset \text{transitive_closure}(R')(x, y)$	
--	--

Repeatedly Skolemizing and flattening,
Installing automatic rewrites from: nth path_start path_end
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of trans_closure_char.2.2.1.

trans_closure_char.2.2.2:

<pre> {1} ∀ (t: T, tail: (path_list? [T])): (∀ (x, y: T): (length(tail) ≥ 2 ∧ path_start(tail) = x ∧ path_end(tail) = y ∧ (∀ (i: below(length(tail) - 1)): R'(nth(tail, i), nth(tail, 1 + i)))) ⊃ transitive_closure(R')(x, y)) ⊃ (∀ (x, y: T): (length(cons(t, tail)) ≥ 2 ∧ path_start(cons(t, tail)) = x ∧ path_end(cons(t, tail)) = y ∧ (∀ (i: below(length(cons(t, tail)) - 1)): R'(nth(cons(t, tail), i), nth(cons(t, tail), 1 + i)))) ⊃ transitive_closure(R')(x, y)) </pre>

Repeatedly Skolemizing and flattening,
Installing automatic rewrites from: path_start path_end
Simplifying, rewriting, and recording with decision procedures,
Case splitting on length(tail!1) = 1,
we get 2 subgoals:

trans_closure_char.2.2.2.1:

<pre> {-1} length(tail') = 1 {-2} length(tail') ≥ 1 {-3} ∀ (x, y: T): (length(tail') ≥ 2 ∧ car(tail') = x ∧ nth(tail', length(tail') - 1) = y ∧ (∀ (i: below(length(tail') - 1)): R'(nth(tail', i), nth(tail', 1 + i)))) ⊃ transitive_closure(R')(x, y) {-4} 1 + length(tail') ≥ 2 {-5} t' = x'' {-6} nth(cons(t', tail'), length(tail')) = y'' {-7} ∀ (i: below(length(cons(t', tail')) - 1)): R'(nth(cons(t', tail'), i), nth(cons(t', tail'), 1 + i)) {1} transitive_closure(R')(x'', y'') </pre>

Hiding formulas: -3,
Installing automatic rewrites from: nth
Instantiating the top quantifier in -6 with the terms: 0,
Simplifying, rewriting, and recording with decision procedures,
Expanding the definition of transitive_closure,
Repeatedly Skolemizing and flattening,
Expanding the definition(s) of (subset? member),
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of trans_closure_char.2.2.2.1.

`trans_closure_char.2.2.2.2:`

$\{-1\}$ $\text{length}(\text{tail}') \geq 1$ $\{-2\}$ $\forall (x, y: T):$ $\quad (\text{length}(\text{tail}') \geq 2 \wedge$ $\quad \quad \text{car}(\text{tail}') = x \wedge$ $\quad \quad \text{nth}(\text{tail}', \text{length}(\text{tail}') - 1) = y \wedge$ $\quad \quad (\forall (i: \text{below}(\text{length}(\text{tail}') - 1)):$ $\quad \quad \quad R'(\text{nth}(\text{tail}', i), \text{nth}(\text{tail}', 1 + i)))$ $\quad \quad \supset \text{transitive_closure}(R')(x, y)$	$\{-3\}$ $1 + \text{length}(\text{tail}') \geq 2$ $\{-4\}$ $t' = x''$ $\{-5\}$ $\text{nth}(\text{cons}(t', \text{tail}'), \text{length}(\text{tail}')) = y''$ $\{-6\}$ $\forall (i: \text{below}(\text{length}(\text{cons}(t', \text{tail}')) - 1)):$ $\quad R'(\text{nth}(\text{cons}(t', \text{tail}'), i), \text{nth}(\text{cons}(t', \text{tail}'), 1 + i))$
$\{1\}$ $\text{length}(\text{tail}') = 1$ $\{2\}$ $\text{transitive_closure}(R')(x'', y'')$	

Expanding the definition of `nth`,

Simplifying, rewriting, and recording with decision procedures,

Instantiating the top quantifier in -2 with the terms: `car(tail')`, `y''`,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 2 subgoals:

`trans_closure_char.2.2.2.2.1:`

$\{-1\}$ $\text{length}(\text{tail}') \geq 1$ $\{-2\}$ $\text{nth}(\text{tail}', \text{length}(\text{tail}') - 1) = y''$ $\{-3\}$ $\text{transitive_closure}(R')(\text{car}(\text{tail}'), y'')$ $\{-4\}$ $1 + \text{length}(\text{tail}') \geq 2$ $\{-5\}$ $t' = x''$ $\{-6\}$ $\forall (i: \text{below}(\text{length}(\text{cons}(t', \text{tail}')) - 1)):$ $\quad R'(\text{nth}(\text{cons}(t', \text{tail}'), i), \text{nth}(\text{cons}(t', \text{tail}'), 1 + i))$	
$\{1\}$ $\text{length}(\text{tail}') = 1$ $\{2\}$ $\text{transitive_closure}(R')(x'', y'')$	

Instantiating the top quantifier in -6 with the terms: 0,

Installing automatic rewrites from: `nth`

Simplifying, rewriting, and recording with decision procedures,

Replacing using formula -5,

Hiding formulas: -1, -2, -4, -5,

Expanding the definition of `transitive_closure`,

Repeatedly Skolemizing and flattening,

Instantiating quantified variables,

Simplifying, rewriting, and recording with decision procedures,

Expanding the definition of `transitive?`,

Instantiating the top quantifier in -4 with the terms: `x''`, `car(tail')`, `y''`,

Simplifying, rewriting, and recording with decision procedures,

Expanding the definition(s) of (`subset?` `member`),

Instantiating the top quantifier in -3 with the terms: (`x''`, `car(tail')`),

Simplifying, rewriting, and recording with decision procedures,

This completes the proof of `trans_closure_char.2.2.2.2.1`.

trans_closure_char.2.2.2.2.2:

{-1} length(tail') ≥ 1 {-2} nth(tail', length(tail') - 1) = y'' {-3} 1 + length(tail') ≥ 2 {-4} t' = x'' {-5} ∀ (i: below(length(cons(t', tail')) - 1)): R'(nth(cons(t', tail'), i), nth(cons(t', tail'), 1 + i))	{1} length(tail') = 1 {2} ∀ (i: below(length(tail') - 1)): R'(nth(tail', i), nth(tail', 1 + i)) {3} transitive_closure(R')(x'', y'')
--	---

Keeping (-5 2) and hiding *,
 Repeatedly Skolemizing and flattening,
 Instantiating the top quantifier in -2 with the terms: i' + 1,
 Installing automatic rewrites from: nth
 Simplifying, rewriting, and recording with decision procedures,
 This completes the proof of trans_closure_char.2.2.2.2.2.
 Q.E.D.

C.99 Proofs for Graph_Util (graph.pvs)

C.99.1 Graph_Util.every_nth

Terse proof for every_nth.

every_nth:

{1} ∀ (P: PRED[T], l: list[T]): every(P)(l) ≡ (∀ (i: below(length(l))): P(nth(l, i)))
--

Inducting on l on formula 1,
 we get 2 subgoals:

every_nth.1:

{1} ∀ (P: PRED[T]): every(P)(null) ≡ (∀ (i: below(length(null))): P(nth(null, i)))

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of every_nth.1.

every_nth.2:

{1} ∀ (cons1_var: T, cons2_var: list[T]): (∀ (P: PRED[T]): every(P)(cons2_var) ≡ (∀ (i: below(length(cons2_var))): P(nth(cons2_var, i)))) ⊃ (∀ (P: PRED[T]): every(P)(cons(cons1_var, cons2_var)) ≡ (∀ (i: below(length(cons(cons1_var, cons2_var)))): P(nth(cons(cons1_var, cons2_var), i)))

Repeatedly Skolemizing and flattening,
 Applying propositional simplification,
 we get 2 subgoals:

every_nth.2.1:

$$\begin{array}{|l}
 \{-1\} \text{ every}(P')(\text{cons}(\text{cons1_var}', \text{cons2_var}')) \\
 \{-2\} \forall (P: \text{PRED}[T]): \\
 \quad \text{every}(P)(\text{cons2_var}') \equiv \\
 \quad (\forall (i: \text{below}(\text{length}(\text{cons2_var}'))): P(\text{nth}(\text{cons2_var}', i))) \\
 \hline
 \{1\} \forall (i: \text{below}(\text{length}(\text{cons}(\text{cons1_var}', \text{cons2_var}')))): \\
 \quad P'(\text{nth}(\text{cons}(\text{cons1_var}', \text{cons2_var}'), i))
 \end{array}$$

Expanding the definition of every,
 Applying disjunctive simplification to flatten sequent,
 Instantiating quantified variables,
 Simplifying, rewriting, and recording with decision procedures,
 Repeatedly Skolemizing and flattening,
 Expanding the definition of length,
 Expanding the definition of nth,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 Instantiating the top quantifier in -4 with the terms: $i' - 1$,
 This completes the proof of **every_nth.2.1**.

every_nth.2.2:

$$\begin{array}{|l}
 \{-1\} \forall (i: \text{below}(\text{length}(\text{cons}(\text{cons1_var}', \text{cons2_var}')))): \\
 \quad P'(\text{nth}(\text{cons}(\text{cons1_var}', \text{cons2_var}'), i)) \\
 \{-2\} \forall (P: \text{PRED}[T]): \\
 \quad \text{every}(P)(\text{cons2_var}') \equiv \\
 \quad (\forall (i: \text{below}(\text{length}(\text{cons2_var}'))): P(\text{nth}(\text{cons2_var}', i))) \\
 \hline
 \{1\} \text{ every}(P')(\text{cons}(\text{cons1_var}', \text{cons2_var}'))
 \end{array}$$

Expanding the definition of every,
 Applying propositional simplification,
 we get 2 subgoals:

every_nth.2.2.1:

$$\begin{array}{|l}
 \{-1\} \forall (i: \text{below}(\text{length}(\text{cons}(\text{cons1_var}', \text{cons2_var}')))): \\
 \quad P'(\text{nth}(\text{cons}(\text{cons1_var}', \text{cons2_var}'), i)) \\
 \{-2\} \forall (P: \text{PRED}[T]): \\
 \quad \text{every}(P)(\text{cons2_var}') \equiv \\
 \quad (\forall (i: \text{below}(\text{length}(\text{cons2_var}'))): P(\text{nth}(\text{cons2_var}', i))) \\
 \hline
 \{1\} P'(\text{cons1_var}')
 \end{array}$$

Instantiating the top quantifier in -1 with the terms: 0,
 we get 2 subgoals:

every_nth.2.2.1.1:

$$\begin{array}{|l}
 \{-1\} P'(\text{nth}(\text{cons}(\text{cons1_var}', \text{cons2_var}'), 0)) \\
 \{-2\} \forall (P: \text{PRED}[T]): \\
 \quad \text{every}(P)(\text{cons2_var}') \equiv \\
 \quad (\forall (i: \text{below}(\text{length}(\text{cons2_var}'))): P(\text{nth}(\text{cons2_var}', i))) \\
 \hline
 \{1\} P'(\text{cons1_var}')
 \end{array}$$

Expanding the definition of nth,
 which is trivially true.

This completes the proof of **every_nth.2.2.1.1**.

every_nth.2.2.1.2:

$$\frac{\begin{array}{l} \{-1\} \quad \forall (P: \text{PRED}[T]): \\ \quad \text{every}(P)(\text{cons2_var}') \equiv \\ \quad (\forall (i: \text{below}(\text{length}(\text{cons2_var}'))): P(\text{nth}(\text{cons2_var}', i))) \end{array}}{\begin{array}{l} \{1\} \quad 0 < \text{length}[T](\text{cons}[T](\text{cons1_var}', \text{cons2_var}')) \\ \{2\} \quad P'(\text{cons1_var}') \end{array}}$$

Expanding the definition of length,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of every_nth.2.2.1.2.

every_nth.2.2.2:

$$\frac{\begin{array}{l} \{-1\} \quad \forall (i: \text{below}(\text{length}(\text{cons}(\text{cons1_var}', \text{cons2_var}')))): \\ \quad P'(\text{nth}(\text{cons}(\text{cons1_var}', \text{cons2_var}'), i)) \\ \{-2\} \quad \forall (P: \text{PRED}[T]): \\ \quad \text{every}(P)(\text{cons2_var}') \equiv \\ \quad (\forall (i: \text{below}(\text{length}(\text{cons2_var}'))): P(\text{nth}(\text{cons2_var}', i))) \end{array}}{\{1\} \quad \text{every}(P')(\text{cons2_var}')}$$

Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
Hiding formulas: 1,
Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in -2 with the terms: $i' + 1$,
we get 2 subgoals:

every_nth.2.2.2.1:

$$\frac{\begin{array}{l} \{-1\} \quad i' < \text{length}(\text{cons2_var}') \\ \{-2\} \quad P'(\text{nth}(\text{cons}(\text{cons1_var}', \text{cons2_var}'), i' + 1)) \end{array}}{\{1\} \quad P'(\text{nth}(\text{cons2_var}', i'))}$$

Expanding the definition of nth,
which is trivially true.
This completes the proof of every_nth.2.2.2.1.

every_nth.2.2.2.2:

$$\frac{\{-1\} \quad i' < \text{length}(\text{cons2_var}')}{\begin{array}{l} \{1\} \quad 1 + i' < \text{length}[T](\text{cons}[T](\text{cons1_var}', \text{cons2_var}')) \\ \{2\} \quad P'(\text{nth}(\text{cons2_var}', i')) \end{array}}$$

Expanding the definition of length,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of every_nth.2.2.2.2.
Q.E.D.

C.99.2 Graph_Util.nth_append_left_TCC1

Terse proof for nth_append_left_TCC1.

nth_append_left_TCC1:

$$\frac{}{\{1\} \quad \forall (l_1, l_2: \text{list}[T], n: \text{nat}): \\ \quad n < \text{length}(l_1) \supset n < \text{length}[T](\text{append}[T](l_1, l_2))}$$

Repeatedly Skolemizing and flattening,
Rewriting using length_append, matching in *,

Simplifying, rewriting, and recording with decision procedures,
 This completes the proof of `nth_append_left_TCC1`.
 Q.E.D.

C.99.3 Graph_Util.nth_append_left

Terse proof for `nth_append_left`.

`nth_append_left`:

$$\frac{}{\{1\} \quad \forall (l_1, l_2: \text{list}[T], n: \text{nat}): \\ n < \text{length}(l_1) \supset \text{nth}(\text{append}(l_1, l_2), n) = \text{nth}(l_1, n)}$$

Inducting on l_1 on formula 1,
 we get 3 subgoals:

`nth_append_left.1`:

$$\frac{}{\{1\} \quad \forall (l_2: \text{list}[T], n: \text{nat}): \\ n < \text{length}(\text{null}) \supset \text{nth}(\text{append}(\text{null}, l_2), n) = \text{nth}(\text{null}, n)}$$

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of `nth_append_left.1`.

`nth_append_left.2`:

$$\frac{}{\{1\} \quad \forall (\text{cons1_var}: T, \text{cons2_var}: \text{list}[T]): \\ (\forall (l_2: \text{list}[T], n: \text{nat}): \\ n < \text{length}(\text{cons2_var}) \supset \text{nth}(\text{append}(\text{cons2_var}, l_2), n) = \text{nth}(\text{cons2_var}, n)) \\ \supset \\ (\forall (l_2: \text{list}[T], n: \text{nat}): \\ n < \text{length}(\text{cons}(\text{cons1_var}, \text{cons2_var})) \supset \\ \text{nth}(\text{append}(\text{cons}(\text{cons1_var}, \text{cons2_var}), l_2), n) = \\ \text{nth}(\text{cons}(\text{cons1_var}, \text{cons2_var}), n))}$$

Repeatedly Skolemizing and flattening,
 Expanding the definition of `append`,
 Expanding the definition of `nth`,
 Expanding the definition of `length`,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 Rewriting using `-2`, matching in `*`,
 This completes the proof of `nth_append_left.2`.

`nth_append_left.3`:

$$\frac{}{\{1\} \quad \forall (l_1, l_2: \text{list}[T], n: \text{nat}): \\ n < \text{length}(l_1) \supset n < \text{length}[T](\text{append}[T](l_1, l_2)) \\ \{2\} \quad \forall (l_2: \text{list}[T], n: \text{nat}): \\ n < \text{length}(l'_1) \supset \text{nth}(\text{append}(l'_1, l_2), n) = \text{nth}(l'_1, n)}$$

Hiding formulas: 2,
 Repeatedly Skolemizing and flattening,
 Rewriting using `length_append`, matching in `*`,
 Simplifying, rewriting, and recording with decision procedures,
 This completes the proof of `nth_append_left.3`.
 Q.E.D.

C.99.4 Graph_Util.nth_append_right_TCC1

Terse proof for nth_append_right_TCC1.

nth_append_right_TCC1:

$$\{1\} \quad \forall (l_1, l_2: \text{list}[T], n: \text{nat}):$$

$$n \geq \text{length}(l_1) \wedge n < \text{length}(\text{append}(l_1, l_2)) \supset$$

$$n - \text{length}[T](l_1) \geq 0 \wedge n - \text{length}[T](l_1) < \text{length}[T](l_2)$$

Repeatedly Skolemizing and flattening,
 Simplifying, rewriting, and recording with decision procedures,
 Rewriting using length_append, matching in *,
 Simplifying, rewriting, and recording with decision procedures,
 This completes the proof of nth_append_right_TCC1.
 Q.E.D.

C.99.5 Graph_Util.nth_append_right

Terse proof for nth_append_right.

nth_append_right:

$$\{1\} \quad \forall (l_1, l_2: \text{list}[T], n: \text{nat}):$$

$$n \geq \text{length}(l_1) \wedge n < \text{length}(\text{append}(l_1, l_2)) \supset$$

$$\text{nth}(\text{append}(l_1, l_2), n) = \text{nth}(l_2, n - \text{length}(l_1))$$

Inducting on l_1 on formula 1,
 we get 3 subgoals:

nth_append_right.1:

$$\{1\} \quad \forall (l_2: \text{list}[T], n: \text{nat}):$$

$$n \geq \text{length}(\text{null}) \wedge n < \text{length}(\text{append}(\text{null}, l_2)) \supset$$

$$\text{nth}(\text{append}(\text{null}, l_2), n) = \text{nth}(l_2, n - \text{length}(\text{null}))$$

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of nth_append_right.1.

nth_append_right.2:

$$\{1\} \quad \forall (\text{cons1_var}: T, \text{cons2_var}: \text{list}[T]):$$

$$(\forall (l_2: \text{list}[T], n: \text{nat}):$$

$$n \geq \text{length}(\text{cons2_var}) \wedge n < \text{length}(\text{append}(\text{cons2_var}, l_2)) \supset$$

$$\text{nth}(\text{append}(\text{cons2_var}, l_2), n) = \text{nth}(l_2, n - \text{length}(\text{cons2_var})))$$

$$\supset$$

$$(\forall (l_2: \text{list}[T], n: \text{nat}):$$

$$n \geq \text{length}(\text{cons}(\text{cons1_var}, \text{cons2_var})) \wedge$$

$$n < \text{length}(\text{append}(\text{cons}(\text{cons1_var}, \text{cons2_var}), l_2))$$

$$\supset$$

$$\text{nth}(\text{append}(\text{cons}(\text{cons1_var}, \text{cons2_var}), l_2), n) =$$

$$\text{nth}(l_2, n - \text{length}(\text{cons}(\text{cons1_var}, \text{cons2_var}))))$$

Repeatedly Skolemizing and flattening,
 Rewriting using length_append, matching in *,
 Expanding the definition of length,

Expanding the definition of length,
 Expanding the definition of append,
 Expanding the definition of nth,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 Rewriting using -, matching in *,
 Rewriting using length_append, matching in *,
 Simplifying, rewriting, and recording with decision procedures,
 This completes the proof of nth_append_right.2.
 nth_append_right.3:

$\{1\} \quad \forall (l_1, l_2: \text{list}[T], n: \text{nat}):$ $n \geq \text{length}(l_1) \wedge n < \text{length}(\text{append}(l_1, l_2)) \supset$ $n - \text{length}[T](l_1) \geq 0 \wedge n - \text{length}[T](l_1) < \text{length}[T](l_2)$ $\{2\} \quad \forall (l_2: \text{list}[T], n: \text{nat}):$ $n \geq \text{length}(l'_1) \wedge n < \text{length}(\text{append}(l'_1, l_2)) \supset$ $\text{nth}(\text{append}(l'_1, l_2), n) = \text{nth}(l_2, n - \text{length}(l'_1))$

Hiding formulas: 2,
 Repeatedly Skolemizing and flattening,
 Rewriting using length_append, matching in *,
 Simplifying, rewriting, and recording with decision procedures,
 This completes the proof of nth_append_right.3.
 Q.E.D.

C.99.6 Graph_Util.list_pred_card

Terse proof for list_pred_card.
 list_pred_card:

$\{1\} \quad \forall (l: \text{list}[T], P: \text{PRED}[T]):$ $\text{is_finite}(P) \wedge \text{every}(P)(l) \wedge \text{length}(l) > \text{card}(P) \supset$ $(\exists (n_1, n_2: \text{below}(\text{length}(l))): \neg n_1 = n_2 \wedge \text{nth}(l, n_1) = \text{nth}(l, n_2))$

Repeatedly Skolemizing and flattening,
 Letting f name LAMBDA (i: below(length(!1))): nth(!1, i),
 Case splitting on injective?(f),
 we get 2 subgoals:
 list_pred_card.1:

$\{-1\} \quad \text{injective?}(f)$ $\{-2\} \quad (\lambda (i: \text{below}(\text{length}(l'))): \text{nth}(l', i)) = f$ $\{-3\} \quad \text{is_finite}(P')$ $\{-4\} \quad \text{every}(P')(l')$ $\{-5\} \quad \text{length}(l') > \text{card}(P')$ <hr/> $\{1\} \quad \exists (n_1, n_2: \text{below}(\text{length}(l'))): \neg n_1 = n_2 \wedge \text{nth}(l', n_1) = \text{nth}(l', n_2)$

Using lemma bijective_restrict_to_image,
 Simplifying, rewriting, and recording with decision procedures,
 Case splitting on (EXISTS (d: below(length[T](!1))): TRUE) OR (FORALL (r: (image[below(length(!1)), T] (f, fullset[below(length[T](!1)))])): FALSE),
 we get 2 subgoals:

C Proof scripts

list_pred_card.1.1.1:

{-1}	$(\exists (d: \text{below}(\text{length}[T](l'))): \text{TRUE}) \vee$ $(\forall (r:$ $\quad (\text{image}[\text{below}(\text{length}(l')), T](f, \text{fullset}[\text{below}(\text{length}[T](l'))]))):$ $\quad \text{FALSE})$
{-2}	$\text{bijective?}(\text{restrict_to_image}(f))$
{-3}	$\text{injective?}(f)$

{-5}	$\text{is_finite}(P')$
{-6}	$\text{every}(P')(l')$
{-7}	$\text{length}(l') > \text{card}(P')$
{1}	$\exists (n_1, n_2: \text{below}(\text{length}(l'))): \neg n_1 = n_2 \wedge \text{nth}(l', n_1) = \text{nth}(l', n_2)$

Using lemma `bijective_inverse_alt_is_bijective`,

Using lemma `card_bij`,

we get 2 subgoals:

list_pred_card.1.1.1.1:

{-1}	$\text{card}(\text{image}(f, \text{fullset}[\text{below}(\text{length}(l'))])) = \text{length}(l') \equiv$ $(\exists (f_1: [(\text{image}(f, \text{fullset}[\text{below}(\text{length}(l'))])) \rightarrow \text{below}[\text{length}(l')]]):$ $\quad \text{bijective?}(f_1))$
{-2}	$\text{bijective?}[(\text{image}(f, \text{fullset}[\text{below}(\text{length}(l'))])), \text{below}(\text{length}(l'))]$ $(\text{inverse_alt}(\text{restrict_to_image}(f)))$
{-3}	$(\exists (d: \text{below}(\text{length}[T](l'))): \text{TRUE}) \vee$ $(\forall (r:$ $\quad (\text{image}[\text{below}(\text{length}(l')), T](f, \text{fullset}[\text{below}(\text{length}[T](l'))]))):$ $\quad \text{FALSE})$
{-4}	$\text{bijective?}(\text{restrict_to_image}(f))$
{-5}	$\text{injective?}(f)$
{-6}	$(\lambda (i: \text{below}(\text{length}(l'))): \text{nth}(l', i)) = f$
{-7}	$\text{is_finite}(P')$
{-8}	$\text{every}(P')(l')$
{-9}	$\text{length}(l') > \text{card}(P')$
{1}	$\exists (n_1, n_2: \text{below}(\text{length}(l'))): \neg n_1 = n_2 \wedge \text{nth}(l', n_1) = \text{nth}(l', n_2)$

Applying disjunctive simplification to flatten sequent,

Splitting conjunctions,

we get 2 subgoals:

list_pred_card.1.1.1.1:

{-1}	$\text{card}(\text{image}(f, \text{fullset}[\text{below}(\text{length}(l'))])) = \text{length}(l')$
{-2}	$\text{card}(\text{image}(f, \text{fullset}[\text{below}(\text{length}(l'))])) = \text{length}(l') \supset$ $(\exists (f_1: [(\text{image}(f, \text{fullset}[\text{below}(\text{length}(l'))])) \rightarrow \text{below}[\text{length}(l')]]):$ $\text{bijective?}(f_1)$
{-3}	$\text{bijective?}[(\text{image}(f, \text{fullset}[\text{below}(\text{length}(l'))])), \text{below}(\text{length}(l'))]$ $(\text{inverse_alt}(\text{restrict_to_image}(f)))$
{-4}	$(\exists (d: \text{below}(\text{length}[T](l'))): \text{TRUE}) \vee$ $(\forall (r:$ $\text{FALSE})$ $(\text{image}[\text{below}(\text{length}(l')), T](f, \text{fullset}[\text{below}(\text{length}[T](l'))]))):$
{-5}	$\text{bijective?}(\text{restrict_to_image}(f))$
{-6}	$\text{injective?}(f)$
{-7}	$(\lambda (i: \text{below}(\text{length}(l'))): \text{nth}(l', i)) = f$
{-8}	$\text{is_finite}(P')$
{-9}	$\text{every}(P')(l')$
{-10}	$\text{length}(l') > \text{card}(P')$
{1}	$\exists (n_1, n_2: \text{below}(\text{length}(l'))): \neg n_1 = n_2 \wedge \text{nth}(l', n_1) = \text{nth}(l', n_2)$

Simplifying, rewriting, and recording with decision procedures,

Hiding formulas: -2,

Using lemma card_subset,

Simplifying, rewriting, and recording with decision procedures,

Hiding formulas: -1, -2, -3, -4, -5, -6, 2,

Expanding the definition(s) of (fullset subset? member image f),

Repeatedly Skolemizing and flattening,

Rewriting using every_nth, matching in *,

Instantiating quantified variables,

Simplifying, rewriting, and recording with decision procedures,

This completes the proof of list_pred_card.1.1.1.1.

list_pred_card.1.1.1.2:

{-1}	$\text{card}(\text{image}(f, \text{fullset}[\text{below}(\text{length}(l'))])) = \text{length}(l') \supset$ $(\exists (f_1: [(\text{image}(f, \text{fullset}[\text{below}(\text{length}(l'))])) \rightarrow \text{below}[\text{length}(l')]]):$ $\text{bijective?}(f_1)$
{-2}	$\text{bijective?}[(\text{image}(f, \text{fullset}[\text{below}(\text{length}(l'))])), \text{below}(\text{length}(l'))]$ $(\text{inverse_alt}(\text{restrict_to_image}(f)))$
{-3}	$(\exists (d: \text{below}(\text{length}[T](l'))): \text{TRUE}) \vee$ $(\forall (r:$ $\text{FALSE})$ $(\text{image}[\text{below}(\text{length}(l')), T](f, \text{fullset}[\text{below}(\text{length}[T](l'))]))):$
{-4}	$\text{bijective?}(\text{restrict_to_image}(f))$
{-5}	$\text{injective?}(f)$
{-6}	$(\lambda (i: \text{below}(\text{length}(l'))): \text{nth}(l', i)) = f$
{-7}	$\text{is_finite}(P')$
{-8}	$\text{every}(P')(l')$
{-9}	$\text{length}(l') > \text{card}(P')$
{1}	$\exists (f_1: [(\text{image}(f, \text{fullset}[\text{below}(\text{length}(l'))])) \rightarrow \text{below}[\text{length}(l')]]):$ $\text{bijective?}(f_1)$
{2}	$\exists (n_1, n_2: \text{below}(\text{length}(l'))): \neg n_1 = n_2 \wedge \text{nth}(l', n_1) = \text{nth}(l', n_2)$

Hiding formulas: -1, 2,

Instantiating quantified variables,

This completes the proof of list_pred_card.1.1.1.2.

list_pred_card.1.1.2:

{-1}	bijective?(image(f , fullset[below(length(l'))]), below(length(l')) (inverse_alt(restrict_to_image(f))))
{-2}	$(\exists (d: \text{below}(\text{length}[T](l'))): \text{TRUE}) \vee$ $(\forall (r:$ $(\text{image}[\text{below}(\text{length}(l')), T](f, \text{fullset}[\text{below}(\text{length}[T](l'))]))):$ FALSE)
{-3}	bijective?(restrict_to_image(f))
{-4}	injective?(f)
{-5}	$(\lambda (i: \text{below}(\text{length}(l'))): \text{nth}(l', i)) = f$
{-6}	is_finite(P')
{-7}	every(P')(l')
{-8}	length(l') > card(P')
{1}	is_finite[T] (image[below(length(l')), T](f , fullset[below(length[T](l'))]))
{2}	$\exists (n_1, n_2: \text{below}(\text{length}(l'))): \neg n_1 = n_2 \wedge \text{nth}(l', n_1) = \text{nth}(l', n_2)$

Hiding formulas: -1, -2, 2,

Using lemma finite_image,

Keeping 1 and hiding *,

Expanding the definition of is_finite,

Instantiating the top quantifier in 1 with the terms: length(l'), id,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of list_pred_card.1.1.2.

list_pred_card.1.2:

{-1}	bijective?(restrict_to_image(f))
{-2}	injective?(f)
{-3}	$(\lambda (i: \text{below}(\text{length}(l'))): \text{nth}(l', i)) = f$
{-4}	is_finite(P')
{-5}	every(P')(l')
{-6}	length(l') > card(P')
{1}	$(\exists (d: \text{below}(\text{length}[T](l'))): \text{TRUE}) \vee$ $(\forall (r:$ $(\text{image}[\text{below}(\text{length}(l')), T](f, \text{fullset}[\text{below}(\text{length}[T](l'))]))):$ FALSE)
{2}	$\exists (n_1, n_2: \text{below}(\text{length}(l'))): \neg n_1 = n_2 \wedge \text{nth}(l', n_1) = \text{nth}(l', n_2)$

Applying disjunctive simplification to flatten sequent,

Hiding formulas: 3,

Repeatedly Skolemizing and flattening,

Expanding the definition of image,

Repeatedly Skolemizing and flattening,

Instantiating quantified variables,

This completes the proof of list_pred_card.1.2.

list_pred_card.2:

{-1}	$(\lambda (i: \text{below}(\text{length}(l'))): \text{nth}(l', i)) = f$
{-2}	is_finite(P')
{-3}	every(P')(l')
{-4}	length(l') > card(P')
{1}	injective?(f)
{2}	$\exists (n_1, n_2: \text{below}(\text{length}(l'))): \neg n_1 = n_2 \wedge \text{nth}(l', n_1) = \text{nth}(l', n_2)$

Expanding the definition of injective?,
 Repeatedly Skolemizing and flattening,
 Instantiating the top quantifier in 2 with the terms: x'_1, x'_2 ,
 Simplifying, rewriting, and recording with decision procedures,
 Replacing using formula -4,
 Simplifying, rewriting, and recording with decision procedures,
 This completes the proof of `list_pred_card.2`.
 Q.E.D.

C.99.7 Graph_Util.path_start_TCC1

Terse proof for `path_start_TCC1`.

`path_start_TCC1`:

$$\{1\} \quad \forall (l: (\text{path_list?})): \text{cons?}[T](l)$$

Repeatedly Skolemizing and flattening,
 Expanding the definition of `path_list?`,
 Expanding the definition of `length`,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 This completes the proof of `path_start_TCC1`.
 Q.E.D.

C.99.8 Graph_Util.path_end_TCC1

Terse proof for `path_end_TCC1`.

`path_end_TCC1`:

$$\{1\} \quad \forall (l: (\text{path_list?})): \\ \text{length}[T](l) - 1 \geq 0 \wedge \text{length}[T](l) - 1 < \text{length}[T](l)$$

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of `path_end_TCC1`.
 Q.E.D.

C.99.9 Graph_Util.path_list_induction_TCC1

Terse proof for `path_list_induction_TCC1`.

`path_list_induction_TCC1`:

$$\{1\} \quad \forall (t: T): \text{path_list?}(\text{cons}[T](t, \text{null}[T]))$$

Repeatedly Skolemizing and flattening,
 Installing automatic rewrites from: `path_list? length`
 Simplifying, rewriting, and recording with decision procedures,
 This completes the proof of `path_list_induction_TCC1`.
 Q.E.D.

C.99.10 Graph_Util.path_list_induction_TCC2

Terse proof for path_list_induction_TCC2.

path_list_induction_TCC2:

$\{1\} \quad \forall (p: [(\text{path_list?}) \rightarrow \text{boolean}]):$ $\quad (\forall (t: T): p(\text{cons}(t, \text{null}))) \supset$ $\quad (\forall (t_1: T, \text{tail}: (\text{path_list?})): p(\text{tail}) \supset \text{path_list?}(\text{cons}[T](t_1, \text{tail})))$

Repeatedly Skolemizing and flattening,

Hiding formulas: -2, -3,

Installing automatic rewrites from: path_list? length

Simplifying, rewriting, and recording with decision procedures,

This completes the proof of path_list_induction_TCC2.

Q.E.D.

C.99.11 Graph_Util.path_list_induction

Terse proof for path_list_induction.

path_list_induction:

$\{1\} \quad \forall (p: [(\text{path_list?}) \rightarrow \text{boolean}]):$ $\quad (\forall (t: T): p(\text{cons}(t, \text{null}))) \wedge$ $\quad (\forall (t: T, \text{tail}: (\text{path_list?})): p(\text{tail}) \supset p(\text{cons}(t, \text{tail})))$ $\quad \supset (\forall (l: (\text{path_list?})): p(l))$
--

Skolemizing and flattening,

Inducting on l on formula 1,

we get 3 subgoals:

path_list_induction.1:

$\{-1\} \quad \forall (t: T): p'(\text{cons}(t, \text{null}))$ $\{-2\} \quad \forall (t: T, \text{tail}: (\text{path_list?})): p'(\text{tail}) \supset p'(\text{cons}(t, \text{tail}))$
$\{1\} \quad \text{path_list?}(l')$ $\{2\} \quad p'(l')$

Simplifying, rewriting, and recording with decision procedures,

This completes the proof of path_list_induction.1.

path_list_induction.2:

$\{-1\} \quad \forall (t: T): p'(\text{cons}(t, \text{null}))$ $\{-2\} \quad \forall (t: T, \text{tail}: (\text{path_list?})): p'(\text{tail}) \supset p'(\text{cons}(t, \text{tail}))$
$\{1\} \quad \text{path_list?}(\text{null}) \supset p'(\text{null})$

Repeatedly Skolemizing and flattening,

Installing automatic rewrites from: path_list? length

Simplifying, rewriting, and recording with decision procedures,

This completes the proof of path_list_induction.2.

path_list_induction.3:

$\{-1\} \quad \forall (t: T): p'(\text{cons}(t, \text{null}))$ $\{-2\} \quad \forall (t: T, \text{tail}: (\text{path_list?})): p'(\text{tail}) \supset p'(\text{cons}(t, \text{tail}))$
$\{1\} \quad \forall (\text{cons1_var}: T, \text{cons2_var}: \text{list}[T]):$ $\quad (\text{path_list?}(\text{cons2_var}) \supset p'(\text{cons2_var})) \supset$ $\quad \text{path_list?}(\text{cons}(\text{cons1_var}, \text{cons2_var})) \supset p'(\text{cons}(\text{cons1_var}, \text{cons2_var}))$

Repeatedly Skolemizing and flattening,
 Installing automatic rewrites from: path_list? length
 Simplifying, rewriting, and recording with decision procedures,
 Case splitting on cons2_var!1 = null,
 we get 2 subgoals:
 path_list_induction.3.1:

{-1}	cons2_var' = null
{-2}	length(cons2_var') ≥ 1 ⊃ p'(cons2_var')
{-3}	1 + length(cons2_var') ≥ 1
{-4}	∀ (t: T): p'(cons(t, null))
{-5}	∀ (t: T, tail: (path_list?)): p'(tail) ⊃ p'(cons(t, tail))
{1}	
p'(cons(cons1_var', cons2_var'))	

Hiding formulas: -2, -3,
 Instantiating quantified variables,
 Simplifying, rewriting, and recording with decision procedures,
 This completes the proof of path_list_induction.3.1.
 path_list_induction.3.2:

{-1}	length(cons2_var') ≥ 1 ⊃ p'(cons2_var')
{-2}	1 + length(cons2_var') ≥ 1
{-3}	∀ (t: T): p'(cons(t, null))
{-4}	∀ (t: T, tail: (path_list?)): p'(tail) ⊃ p'(cons(t, tail))
{1}	
cons2_var' = null	
{2}	p'(cons(cons1_var', cons2_var'))

Simplifying, rewriting, and recording with decision procedures,
 Rewriting using -4, matching in *,
 This completes the proof of path_list_induction.3.2.
 Q.E.D.

C.99.12 Graph_Util.concat_path_TCC1

Terse proof for concat_path_TCC1.
 concat_path_TCC1:

{1}	∀ (lr: (concatable?)): cons?[T](PROJ_2(lr))
-----	---

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of concat_path_TCC1.
 Q.E.D.

C.99.13 Graph_Util.concat_path_TCC2

Terse proof for concat_path_TCC2.
 concat_path_TCC2:

{1}	∀ (lr: (concatable?)): path_list?(append[T](PROJ_1(lr), cdr[T](PROJ_2(lr))))
-----	--

Repeatedly Skolemizing and flattening,
 Expanding the definition of concatable?,
 Applying disjunctive simplification to flatten sequent,

C Proof scripts

Hiding formulas: -3,
Expanding the definition of `path_list?`,
Rewriting using `length_append`, matching in `*`,
Rewriting using `length_cdr`, matching in `*`,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `concat_path_TCC2`.
Q.E.D.

C.99.14 Graph_Util.length_concat_path

Terse proof for `length_concat_path`.

`length_concat_path`:

$$\frac{\{1\} \quad \forall (l, r: \text{list}[T]): \quad \text{concatable?}(l, r) \supset \quad \text{length}(\text{concat_path}(l, r)) = \text{length}(l) + \text{length}(r) - 1}{}$$

Repeatedly Skolemizing and flattening,
Expanding the definition of `concat_path`,
Rewriting using `length_append`, matching in `*`,
Rewriting using `length_cdr`, matching in `*`,
we get 2 subgoals:

`length_concat_path.1`:

$$\frac{\{1\} \quad \text{concatable?}(l', r')}{\{1\} \quad \text{length}(r') - 1 + \text{length}(l') = \text{length}(l') + \text{length}(r') - 1}$$

Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `length_concat_path.1`.

`length_concat_path.2`:

$$\frac{\{1\} \quad \text{concatable?}(l', r')}{\begin{array}{l} \{1\} \quad \text{length}(r') > 0 \\ \{2\} \quad \text{length}(\text{cdr}(r')) = \text{length}(r') - 1 \end{array}}$$

Expanding the definition of `concatable?`,
Expanding the definition of `path_list?`,
which is trivially true.
This completes the proof of `length_concat_path.2`.
Q.E.D.

C.100 Proofs for Hoare (hoare.pvs)

C.100.1 Hoare.valid_TCC1

Terse proof for `valid_TCC1`.

valid_TCC1:

$$\{1\} \quad \forall (P: \text{PRED}[\text{State}], c: [\text{State} \rightarrow \text{StmtResult}[\text{State}]], s):$$

$$P(s) \wedge \text{OK?}(c(s)) \supset$$

$$\text{OK?}[\text{State}](c(s)) \vee$$

$$\text{Break?}[\text{State}](c(s)) \vee$$

$$\text{Continue?}[\text{State}](c(s)) \vee$$

$$\text{Return?}[\text{State}](c(s)) \vee$$

$$\text{Switch?}[\text{State}](c(s)) \vee$$

$$\text{Default?}[\text{State}](c(s)) \vee \text{Exception?}[\text{State}](c(s))$$

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of valid_TCC1.
 Q.E.D.

C.100.2 Hoare.valid_TCC2

Terse proof for valid_TCC2.

valid_TCC2:

$$\{1\} \quad \forall (P: \text{PRED}[\text{State}], C: [\text{StmtResult}[\text{State}] \rightarrow \text{StmtResult}[\text{State}]], s):$$

$$P(s) \wedge \text{OK?}(C(\text{OK}(s))) \supset$$

$$\text{OK?}[\text{State}](C(\text{OK}[\text{State}](s))) \vee$$

$$\text{Break?}[\text{State}](C(\text{OK}[\text{State}](s))) \vee$$

$$\text{Continue?}[\text{State}](C(\text{OK}[\text{State}](s))) \vee$$

$$\text{Return?}[\text{State}](C(\text{OK}[\text{State}](s))) \vee$$

$$\text{Switch?}[\text{State}](C(\text{OK}[\text{State}](s))) \vee$$

$$\text{Default?}[\text{State}](C(\text{OK}[\text{State}](s))) \vee$$

$$\text{Exception?}[\text{State}](C(\text{OK}[\text{State}](s)))$$

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of valid_TCC2.
 Q.E.D.

C.100.3 Hoare.valid_and

Terse proof for valid_and.

valid_and:

$$\{1\} \quad \forall (P, Q, R: \text{PRED}[\text{State}], c: [\text{State} \rightarrow \text{StmtResult}[\text{State}]]):$$

$$\text{valid}(P, c, Q) \wedge \text{valid}(P, c, R) \supset$$

$$\text{valid}(P, c, \lambda (s: \text{State}): Q(s) \wedge R(s))$$

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of valid_and.
 Q.E.D.

C.100.4 Hoare.valid_implied

Terse proof for valid_implied.

valid_implied:

$$\frac{\{1\} \quad \forall (P, Q, R: \text{PRED}[\text{State}], c: [\text{State} \rightarrow \text{StmtResult}[\text{State}]]) : \text{valid}(P, c, Q) \wedge \text{valid}(P, c, \lambda (s: \text{State}): Q(s) \supset R(s)) \supset \text{valid}(P, c, \lambda (s: \text{State}): Q(s) \wedge R(s))}{}$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `valid_implied`.
Q.E.D.

C.100.5 Hoare.Valid_and

Terse proof for `Valid_and`.

`Valid_and`:

$$\frac{\{1\} \quad \forall (P, Q, R: \text{PRED}[\text{State}], c: [\text{State} \rightarrow \text{StmtResult}[\text{State}]]) : \text{Valid}(P, c, Q) \wedge \text{Valid}(P, c, R) \supset \text{Valid}(P, c, \lambda (s: \text{State}): Q(s) \wedge R(s))}{}$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `Valid_and`.
Q.E.D.

C.101 Proofs for IA32 (constants.pvs)

C.101.1 IA32.max_linear_offset_val

The \LaTeX code for this proof is broken.

C.101.2 IA32.mem_addr_4g_TCC1

Terse proof for `mem_addr_4g_TCC1`.

`mem_addr_4g_TCC1`:

$$\frac{\{1\} \quad \forall (a: \text{Memory_Address_4G}): \text{in_memory}(\text{min_linear}, \text{max_linear})(a)}{}$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `mem_addr_4g_TCC1`.
Q.E.D.

C.102 Proofs for Import_All (everything.pvs)

This theory contains no provable formal statements.

C.103 Proofs for IntegralConversions (conversions.pvs)

This theory contains no provable formal statements.

C.104 Proofs for IntegralPromotions (conversions.pvs)

C.104.1 IntegralPromotions.int_conversion_TCC1

Terse proof for `int_conversion_TCC1`.

`int_conversion_TCC1:`

<pre> {1} ∃ (x: [typ: Cpp_Subtype(cv(extend[Cpp_Type_, Cpp_Type, bool, FALSE] ({t: Cpp_Type char?(t) ∨ schar?(t) ∨ uchar?(t) ∨ short?(t) ∨ ushort?(t)}))) → [(range(typ)) → (range(int))])]: TRUE </pre>

Instantiating the top quantifier in 1 with the terms: $(\lambda (\text{typ}: \text{Cpp_Subtype}(\text{cv}(\text{extend}[\text{Cpp_Type_}, \text{Cpp_Type}, \text{bool}, \text{FALSE}] (\{t: \text{Cpp_Type} \mid \text{char?}(t) \vee \text{schar?}(t) \vee \text{uchar?}(t) \vee \text{short?}(t) \vee \text{ushort?}(t)\})))) \lambda (r: (\text{range}(\text{typ}))) : 0)$,

we get 2 subgoals:

`int_conversion_TCC1.1:`

<pre> {1} TRUE </pre>

which is trivially true.

This completes the proof of `int_conversion_TCC1.1`.

`int_conversion_TCC1.2:`

<pre> {1} ∃ (typ: Cpp_Subtype(cv(extend[Cpp_Type_, Cpp_Type, bool, FALSE] ({t: Cpp_Type char?(t) ∨ schar?(t) ∨ uchar?(t) ∨ short?(t) ∨ ushort?(t)}))), r: (range(typ))): range(int)(0) </pre>
--

Repeatedly Skolemizing and flattening,

Keeping (1) and hiding *,

Trying repeated skolemization, instantiation, and if-lifting,

Rewriting using `int_binary`, matching in *,

Using lemma `min_int`,

Using lemma `max_int`,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `int_conversion_TCC1.2`.

Q.E.D.

C.104.2 IntegralPromotions.int_conversion_spec_TCC1

Terse proof for `int_conversion_spec_TCC1`.

int_conversion_spec_TCC1:

```
{1}  ∇ (typ:
      Cpp_Subtype(cv(extend[Cpp_Type_, Cpp_Type, bool, FALSE]
                        ({t: Cpp_Type |
                          char?(t) ∨
                          schar?(t) ∨
                          uchar?(t) ∨ short?(t) ∨ ushort?(t)}))),
      n: (range(typ))):
      Cpp_Type?(int) ∧ cv(non_bool_integral_enum?)(int)
```

Repeatedly Skolemizing and flattening,
 Keeping (1) and hiding *,
 Applying propositional simplification,
 we get 2 subgoals:

int_conversion_spec_TCC1.1:

```
{1}  Cpp_Type?(int)
```

Expanding the definition of Cpp_Type?,
 Expanding the definition of subterm,
 Repeatedly Skolemizing and flattening,
 Replacing using formula -1,

Installing automatic rewrites from: no_pointers_to_bitfield? no_pointers_to_references?
 no_cv_references? no_reference_to_reference? no_reference_to_bitfields? no_pointer_to_member_to_reference?
 no_pointer_to_member_to_cv_void? no_cv_void_parameter? no_array_of_references? no_array_of_bitfields?
 no_array_of_cv_void? no_array_of_function? no_array_of_abstract_class? no_pointer_or_ref_to_incomplete_array_par

 enum_underlying_integral? enum_constants? const_volatile? const_stutter? volatile_stutter?
 no_cv_class? no_cv_union? no_cv_function? no_reference_to_void? no_cv_void?

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 This completes the proof of int_conversion_spec_TCC1.1.

int_conversion_spec_TCC1.2:

```
{1}  cv(non_bool_integral_enum?)(int)
```

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of int_conversion_spec_TCC1.2.
 Q.E.D.

C.104.3 IntegralPromotions.int_conversion_TCC2

Terse proof for int_conversion_TCC2.

int_conversion_TCC2:

```
{1}  ∇ (typ:
      Cpp_Subtype(cv(extend[Cpp_Type_, Cpp_Type, bool, FALSE]
                        ({t: Cpp_Type |
                          char?(t) ∨
                          schar?(t) ∨
                          uchar?(t) ∨ short?(t) ∨ ushort?(t)}))))):
      cv(non_bool_integral_enum?)(typ)
```

Repeatedly Skolemizing and flattening,
Hiding formulas: -1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `int_conversion_TCC2`.
Q.E.D.

C.104.4 IntegralPromotions.int_conversion_TCC3

Terse proof for `int_conversion_TCC3`.

`int_conversion_TCC3`:

```
{1}  ∃ (typ:
      Cpp_Subtype(cv(extend[Cpp_Type_, Cpp_Type, bool, FALSE]
                        ({t: Cpp_Type |
                          char?(t) ∨
                          schar?(t) ∨
                          uchar?(t) ∨ short?(t) ∨ ushort?(t)})))):
      Cpp_Type?(int) ∧ cv(non_bool_integral_enum?)(int)
```

Repeatedly Skolemizing and flattening,
Keeping (1) and hiding *,
Applying propositional simplification,
we get 2 subgoals:

`int_conversion_TCC3.1`:

```
{1}  Cpp_Type?(int)
```

Expanding the definition of `Cpp_Type?`,
Expanding the definition of subterm,
Repeatedly Skolemizing and flattening,
Replacing using formula -1,

Installing automatic rewrites from: `no_pointers_to_bitfield?` `no_pointers_to_references?`
`no_cv_references?` `no_reference_to_reference?` `no_reference_to_bitfields?` `no_pointer_to_member_to_reference?`
`no_pointer_to_member_to_cv_void?` `no_cv_void_parameter?` `no_array_of_references?` `no_array_of_bitfields?`
`no_array_of_cv_void?` `no_array_of_function?` `no_array_of_abstract_class?` `no_pointer_or_ref_to_incomplete_array_parameter?`
`no_array_return_type?` `no_function_return_type?` `bitfield_underlying_integral_or_enum_type?` `cv_array?`
`enum_underlying_integral?` `enum_constants?` `const_volatile?` `const_stutter?` `volatile_stutter?`
`no_cv_class?` `no_cv_union?` `no_cv_function?` `no_reference_to_void?` `no_cv_void?`

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `int_conversion_TCC3.1`.

`int_conversion_TCC3.2`:

```
{1}  cv(non_bool_integral_enum?)(int)
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `int_conversion_TCC3.2`.
Q.E.D.

C.104.5 IntegralPromotions.bool2int_TCC1

Terse proof for `bool2int_TCC1`.

bool2int_TCC1:

$$\{1\} \quad \forall (b: \text{bool}): b \supset \text{range}(\text{int})(1)$$

Repeatedly Skolemizing and flattening,
 Expanding the definition of range,
 Expanding the definition of range_integral,
 Rewriting using int_binary, matching in *,
 Using lemma min_int,
 Using lemma max_int,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 This completes the proof of bool2int_TCC1.
 Q.E.D.

C.104.6 IntegralPromotions.bool2int_TCC2

Terse proof for bool2int_TCC2.

bool2int_TCC2:

$$\{1\} \quad \forall (b: \text{bool}): \neg b \supset \text{range}(\text{int})(0)$$

Repeatedly Skolemizing and flattening,
 Expanding the definition of range,
 Expanding the definition of range_integral,
 Rewriting using int_binary, matching in *,
 Using lemma max_int,
 Using lemma min_int,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 This completes the proof of bool2int_TCC2.
 Q.E.D.

C.105 Proofs for Interpreted_Data (abstract_data.pvs)

C.105.1 Interpreted_Data.interpreted_data_type?_TCC1

Terse proof for interpreted_data_type?_TCC1.

interpreted_data_type?_TCC1:

$$\{1\} \quad \forall (\text{idt}: \text{Interpreted_data_type}):$$

$$\quad (\forall (l: \text{list}[\text{Byte}], a: \text{Address}):$$

$$\quad \quad \text{valid?}(\text{uidt}(\text{idt}))(l, a) \equiv \text{up?}(\text{from_byte}(\text{idt})(l, a)))$$

$$\quad \wedge$$

$$\quad (\forall (d: \text{Data}, a: \text{Address}): \text{valid?}(\text{uidt}(\text{idt}))(\text{to_byte}(\text{idt})(d, a), a)) \wedge$$

$$\quad \quad \text{uninterpreted_data_type?}(\text{idt}' \text{uidt}))$$

$$\quad \supset$$

$$\quad (\forall (d_1: \text{Data}, a_1: \text{Address}): \text{up?}[\text{Data}](\text{from_byte}(\text{idt})(\text{to_byte}(\text{idt})(d_1, a_1), a_1)))$$

Repeatedly Skolemizing and flattening,
 Instantiating quantified variables,
 Instantiating quantified variables,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `interpreted_data_type?_TCC1`.
Q.E.D.

C.105.2 Interpreted_Data.pod_is_interpreted_data

Terse proof for `pod_is_interpreted_data`.
`pod_is_interpreted_data`:

$$\frac{}{\{1\} \quad \forall (x: (\text{pod_data_type?})): \text{interpreted_data_type?}(x)}$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pod_is_interpreted_data`.
Q.E.D.

C.105.3 Interpreted_Data.pod_size

Terse proof for `pod_size`.
`pod_size`:

$$\frac{}{\{1\} \quad \forall (dt: (\text{pod_data_type?})): \text{size}(\text{uidt}(dt)) > 0}$$

Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of `pod_data_type?`,
which is trivially true.
This completes the proof of `pod_size`.
Q.E.D.

C.105.4 Interpreted_Data.data_type_length

Terse proof for `data_type_length`.
`data_type_length`:

$$\frac{}{\{1\} \quad \forall (\text{addr}: \text{Address}, \text{idt}: (\text{interpreted_data_type?}), l: \text{list}[\text{Byte}]): \\ \text{valid?}(\text{uidt}(\text{idt}))(l, \text{addr}) \supset \text{length}(l) = \text{size}(\text{uidt}(\text{idt}))}$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `data_type_length`.
Q.E.D.

C.105.5 Interpreted_Data.length_to_byte

Terse proof for `length_to_byte`.
`length_to_byte`:

$$\frac{}{\{1\} \quad \forall (\text{addr}: \text{Address}, \text{idt}: (\text{interpreted_data_type?}), \text{data}: \text{Data}): \\ \text{length}(\text{to_byte}(\text{idt})(\text{data}, \text{addr})) = \text{size}(\text{uidt}(\text{idt}))}$$

Repeatedly Skolemizing and flattening,
Expanding the definition of `interpreted_data_type?`,
Expanding the definition of `uninterpreted_data_type?`,

C Proof scripts

Applying disjunctive simplification to flatten sequent,
Instantiating the top quantifier in -1 with the terms: (to_byte(idt!1)(data!1, addr!1) addr!1),
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Instantiating quantified variables,
This completes the proof of length_to_byte.
Q.E.D.

C.105.6 Interpreted_Data.valid_from_byte

Terse proof for valid_from_byte.

valid_from_byte:

$$\{1\} \quad \forall (\text{addr}: \text{Address}, \text{idt}: (\text{interpreted_data_type?}), l: \text{list}[\text{Byte}]):$$

$$\text{idt}'\text{uidt}'\text{valid?}(l, \text{addr}) \supset \text{up?}(\text{from_byte}(\text{idt})(l, \text{addr}))$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of valid_from_byte.
Q.E.D.

C.105.7 Interpreted_Data.valid_iff_from_byte

Terse proof for valid_iff_from_byte.

valid_iff_from_byte:

$$\{1\} \quad \forall (\text{addr}: \text{Address}, \text{idt}: (\text{interpreted_data_type?}), l: \text{list}[\text{Byte}]):$$

$$\text{idt}'\text{uidt}'\text{valid?}(l, \text{addr}) \Leftrightarrow \text{up?}(\text{from_byte}(\text{idt})(l, \text{addr}))$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of valid_iff_from_byte.
Q.E.D.

C.105.8 Interpreted_Data.valid_to_byte

Terse proof for valid_to_byte.

valid_to_byte:

$$\{1\} \quad \forall (\text{addr}: \text{Address}, \text{idt}: (\text{interpreted_data_type?}), \text{data}: \text{Data}):$$

$$\text{idt}'\text{uidt}'\text{valid?}(\text{to_byte}(\text{idt})(\text{data}, \text{addr}), \text{addr})$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of valid_to_byte.
Q.E.D.

C.105.9 Interpreted_Data.up_from_byte_to_byte

Terse proof for up_from_byte_to_byte.

up_from_byte_to_byte:

$$\{1\} \quad \forall (\text{addr}: \text{Address}, \text{idt}: (\text{interpreted_data_type?}), \text{data}: \text{Data}):$$

$$\text{up?}(\text{from_byte}(\text{idt})(\text{to_byte}(\text{idt})(\text{data}, \text{addr}), \text{addr}))$$

Repeatedly Skolemizing and flattening,
 Expanding the definition of interpreted_data_type?,
 Applying disjunctive simplification to flatten sequent,
 Instantiating quantified variables,
 Instantiating quantified variables,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 This completes the proof of up_from_byte_to_byte.
 Q.E.D.

C.105.10 Interpreted_Data.from_byte_to_byte

Terse proof for from_byte_to_byte.

from_byte_to_byte:

$$\{1\} \quad \forall (\text{addr}: \text{Address}, \text{idt}: (\text{interpreted_data_type?}), \text{data}: \text{Data}):$$

$$\text{from_byte}(\text{idt})(\text{to_byte}(\text{idt})(\text{data}, \text{addr}), \text{addr}) = \text{up}(\text{data})$$

Trying repeated skolemization, instantiation, and if-lifting,
 Applying extensionality,
 This completes the proof of from_byte_to_byte.
 Q.E.D.

C.105.11 Interpreted_Data.in_blessed_memory_subset

Terse proof for in_blessed_memory_subset.

in_blessed_memory_subset:

$$\{1\} \quad \forall (\text{addr}: \text{Address}, \text{idt}: (\text{interpreted_data_type?}), \text{address_range}: \text{PRED}[\text{Address}]):$$

$$\text{in_blessed_memory?}(\text{idt}, \text{addr}, \text{address_range}) \supset$$

$$(\text{address_block}(\text{addr}, \text{size}(\text{uidt}(\text{idt}))) \subseteq \text{address_range})$$

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of in_blessed_memory_subset.
 Q.E.D.

C.106 Proofs for Interpreted_Data_Lift (abstract_data.pvs)

This theory contains no provable formal statements.

C.107 Proofs for IterationStatements1 (statements.pvs)

C.107.1 IterationStatements1.iterate_while_TCC1

Terse proof for iterate_while_TCC1.

iterate_while_TCC1:

$$\{1\} \quad \forall (n: \text{nat}, s: \text{State}): \neg n = 0 \supset n - 1 \geq 0$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `iterate_while_TCC1`.
Q.E.D.

C.107.2 IterationStatements1.iterate_while_TCC2

Terse proof for `iterate_while_TCC2`.

`iterate_while_TCC2`:

$$\{1\} \quad \forall (n: \text{nat}, s: \text{State}): \neg n = 0 \supset n - 1 < n$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `iterate_while_TCC2`.
Q.E.D.

C.107.3 IterationStatements1.while_termination_point?_TCC1

Terse proof for `while_termination_point?_TCC1`.

`while_termination_point?_TCC1`:

$$\{1\} \quad \forall (b_ex: [\text{State} \rightarrow \text{ExprResult}[\text{State}, \text{bool}]], \text{body}: [\text{State} \rightarrow \text{StmtResult}[\text{State}]], \\ s: \text{State}, n: \text{nat}, \text{res}: \text{StmtResult}[\text{State}]): \\ \text{OK?}[\text{res}] \wedge \text{res} = \text{iterate_while}(n, b_ex, \text{body})(s) \supset \\ \text{OK?}[\text{State}](\text{res}) \vee \\ \text{Break?}[\text{State}](\text{res}) \vee \\ \text{Continue?}[\text{State}](\text{res}) \vee \\ \text{Return?}[\text{State}](\text{res}) \vee \\ \text{Switch?}[\text{State}](\text{res}) \vee \text{Default?}[\text{State}](\text{res}) \vee \text{Exception?}[\text{State}](\text{res})$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `while_termination_point?_TCC1`.
Q.E.D.

C.107.4 IterationStatements1.while_TCC1

Terse proof for `while_TCC1`.

`while_TCC1`:

$$\{1\} \quad \forall (b_ex: [\text{State} \rightarrow \text{ExprResult}[\text{State}, \text{bool}]], \text{body}: [\text{State} \rightarrow \text{StmtResult}[\text{State}]], \\ s: \text{State}): \\ (\exists (n: \text{nat}): \text{while_termination_point?}(b_ex, \text{body}, s)(n)) \supset \\ \text{nonempty?}[\text{nat}](\text{while_termination_point?}(b_ex, \text{body}, s))$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `while_TCC1`.
Q.E.D.

C.107.5 IterationStatements1.nonzero_min_while_termination_point

Terse proof for `nonzero_min_while_termination_point`.

nonzero_min_while_termination_point:

$$\frac{\{1\} \quad \forall (b_ex: [State \rightarrow ExprResult[State, bool]], body: [State \rightarrow StmtResult[State]]), \quad s: State):}{(\exists (n: nat): while_termination_point?(b_ex, body, s)(n)) \wedge \neg \min[nat](while_termination_point?(b_ex, body, s)) = 0 \supset OK?(b_ex(s)) \wedge data(b_ex(s))}$$

Repeatedly Skolemizing and flattening,

Rewriting using min_def, matching in *,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of nonzero_min_while_termination_point.

Q.E.D.

C.107.6 IterationStatements1.while_as_if_while

Terse proof for while_as_if_while.

while_as_if_while:

$$\frac{\{1\} \quad \forall (b_ex: [State \rightarrow ExprResult[State, bool]], body: [State \rightarrow StmtResult[State]]):}{while(b_ex, body) = if_else(b_ex, body \#\# catch_continue \#\# while(b_ex, body) \#\# catch_break, skip)}$$

Expanding the definition of while,

Expanding the definition of if_else,

Repeatedly Skolemizing and flattening,

Applying decompose-equality,

we get 3 subgoals:

while_as_if_while.1:

```

{1} IF ∃ (n: nat): while_termination_point?(b_ex', body', x')(n)
      THEN (iterate_while(min[nat](while_termination_point?(b_ex', body', x')), b_ex',
                          body')
            ## e2s(b_ex')
            ## catch_break)
            (x')
ELSE Hang
ENDIF
=
(b_ex' ##
  (λ (b: bool):
    IF b
      THEN (body' ## catch_continue ##
            (λ (s: State):
              IF ∃ (n: nat): while_termination_point?(b_ex', body', s)(n)
                THEN (iterate_while(min[nat]
                                     (while_termination_point?(b_ex',
                                                                body',
                                                                s)),
                                     b_ex', body')
                      ## e2s(b_ex')
                      ## catch_break)
                      (s)
                ELSE Hang
                ENDIF))
            ## catch_break
      ELSE skip
      ENDIF))
  (x')

```

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 2 subgoals:

while_as_if_while.1.1:

{-1}	$\exists (n: \text{nat}): \text{while_termination_point?}(\text{b_ex}', \text{body}', x')(n)$
{1}	<pre> iterate_while(min[nat](while_termination_point?(b_ex', body', x')), b_ex', body') ## e2s(b_ex') ## catch_break (x') = (b_ex' ## (\lambda (b: bool): IF b THEN (body' ## catch_continue ## (\lambda (s: State): IF \exists (n: nat): while_termination_point?(b_ex', body', s)(n) THEN (iterate_while(min[nat] (while_termination_point?(b_ex', body', s)), b_ex', body') ## e2s(b_ex') ## catch_break (s) ELSE Hang ENDIF)) ## catch_break ELSE skip ENDIF)) (x') </pre>

Case splitting on $\min(\text{while_termination_point?}(\text{b_ex!1}, \text{body!1}, \text{x!1})) = 0$,

we get 2 subgoals:

C Proof scripts

`while_as_if_while.1.1.1:`

```

{-1} min(while_termination_point?(b_ex', body', x')) = 0
{-2} ∃ (n: nat): while_termination_point?(b_ex', body', x')(n)
-----
{1} (iterate_while(min [nat](while_termination_point?(b_ex', body', x')), b_ex', body') ##
    e2s(b_ex')
    ## catch_break)
    (x')
=
(b_ex' ##
  (λ (b: bool):
    IF b
      THEN (body' ## catch_continue ##
            (λ (s: State):
              IF ∃ (n: nat): while_termination_point?(b_ex', body', s)(n)
                THEN (iterate_while(min [nat]
                                     (while_termination_point?(b_ex',
                                                                body',
                                                                s)),
                                     b_ex', body')
                        ## e2s(b_ex')
                        ## catch_break)
                (s)
              ELSE Hang
              ENDIF))
            ## catch_break)
    ELSE skip
    ENDIF))
  (x')

```

Replacing using formula -1,

Rewriting using `min_def`, matching in `*`,

Expanding the definition of `minimum?`,

Expanding the definition of `while_termination_point?`,

Expanding the definition of `iterate_while`,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `while_as_if_while.1.1.1`.

while_as_if_while.1.1.2:

{-1}	$\exists (n: \text{nat}): \text{while_termination_point?}(\text{b_ex}', \text{body}', x')(n)$
{1}	$\text{min}(\text{while_termination_point?}(\text{b_ex}', \text{body}', x')) = 0$
{2}	<pre> (iterate_while(min[nat](while_termination_point?(b_ex', body', x')), b_ex', body') ## e2s(b_ex') ## catch_break) (x') = (b_ex' ## (\lambda (b: bool): IF b THEN (body' ## catch_continue ## (\lambda (s: State): IF \exists (n: nat): while_termination_point?(b_ex', body', s)(n) THEN (iterate_while(min[nat] (while_termination_point?(b_ex', body', s)), b_ex', body') ## e2s(b_ex') ## catch_break) (s) ELSE Hang ENDIF)) ## catch_break ELSE skip ENDIF)) (x') </pre>

Using lemma nonzero_min_while_termination_point,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Expanding the definition of iterate_while,

Expanding the definition of ##,

Expanding the definition of lift,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 2 subgoals:

while_as_if_while.1.1.2.1:

{-1}	$\exists (n: \text{nat}): \text{while_termination_point?}(\text{b_ex}', \text{body}', x')(n)$
{-2}	$\text{OK?}(\text{b_ex}'(x'))$
{-3}	$\text{data}(\text{b_ex}'(x'))$
{-4}	$\text{OK?}(\text{e2s}(\text{b_ex}')(x'))$
{1}	$\text{min}(\text{while_termination_point?}(\text{b_ex}', \text{body}', x')) = 0$
{2}	$\text{catch_break}(\text{lift}(\text{e2s}(\text{b_ex}'))$ $\quad (\text{lift}(\text{iterate_while}(\text{min} [\text{nat}] (\text{while_termination_point?}(\text{b_ex}', \text{body}', x')) - 1,$ $\quad \quad \quad \text{b_ex}', \text{body}'))$ $\quad (\text{catch_continue}(\text{body}'(\text{state}(\text{e2s}(\text{b_ex}')(x'))))))))$ $=$ $\text{catch_break}(\text{lift}(\lambda (s: \text{State}):$ $\quad \text{IF } \exists (n: \text{nat}): \text{while_termination_point?}(\text{b_ex}', \text{body}', s)(n)$ $\quad \quad \text{THEN } \text{catch_break}(\text{lift}(\text{e2s}(\text{b_ex}'))$ $\quad \quad \quad (\text{iterate_while}(\text{min} [\text{nat}]$ $\quad \quad \quad \quad (\text{while_termination_point?}(\text{b_ex}', \text{body}', s)),$ $\quad \quad \quad \quad \text{b_ex}',$ $\quad \quad \quad \quad \text{body}'))$ $\quad \quad \quad (s)))$ $\quad \quad \quad \text{ELSE Hang}$ $\quad \quad \quad \text{ENDIF})$ $\quad (\text{catch_continue}(\text{body}'(\text{state}(\text{b_ex}'(x'))))))))$

Expanding the definition of e2s,

Expanding the definition of lift,

Case splitting on $\text{OK?}(\text{catch_continue}(\text{body}'!1(\text{state}(\text{b_ex}'!1(x!1))))$,

we get 2 subgoals:

<pre> {-1} ∃ (n: nat): while_termination_point?(b_ex', body', state((e2s(b_ex') ## body' ## catch_continue ## (λ (s): OK(s))) (x'))) (n) {-2} OK?(b_ex'(x')) {-3} data(b_ex'(x')) {-4} OK?((e2s(b_ex') ## body' ## catch_continue ## (λ (s): OK(s)))(x')) {-5} OK?(b_ex'(state((e2s(b_ex') ## body' ## catch_continue ## (λ (s): OK(s))) (x')))) {-6} data(b_ex'(state((e2s(b_ex') ## body' ## catch_continue ## (λ (s): OK(s))) (x')))) </pre>	<hr style="border: 0.5px solid black;"/> <pre> {1} ∃ (n: nat): while_termination_point?(b_ex', body', x')(n) {2} Hang?((b_ex' ## (λ (b: bool): IF b THEN (body' ## catch_continue ## (λ (s: State): IF ∃ (n: nat): while_termination_point?(b_ex', body', s)(n) THEN (iterate_while(min[nat] (while_termination_point?(b_ex' b_ex', body') ## e2s(b_ex') ## catch_break) (s) ELSE Hang ENDIF)) ## catch_break ELSE λ (s: State): OK(s) ENDIF)) (x')) </pre>
--	--

Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in 1 with the terms: (n' + 1),
Expanding the definition of while_termination_point?,
Expanding the definition of iterate_while,
Applying disjunctive simplification to flatten sequent,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of **while_as_if_while.1.2.1**.

while_as_if_while.1.2.2:

<pre> {-1} OK?(b_ex'(x')) {-2} data(b_ex'(x')) {-3} OK?((e2s(b_ex') ## body' ## catch_continue ## (λ (s): OK(s)))(x')) {-4} OK?(b_ex'(state((e2s(b_ex') ## body' ## catch_continue ## (λ (s): OK(s)) (x')))) {-5} data(b_ex'(state((e2s(b_ex') ## body' ## catch_continue ## (λ (s): OK(s)) (x')))) </pre>	<pre> {1} ∃ (n: nat): while_termination_point?(b_ex', body', state((e2s(b_ex') ## body' ## catch_continue ## (λ (s): OK(s)) (x'))) (n) {2} ∃ (n: nat): while_termination_point?(b_ex', body', x')(n) {3} Hang?((b_ex' ## (λ (b: bool): IF b THEN (body' ## catch_continue ## (λ (s: State): IF ∃ (n: nat): while_termination_point?(b_ex', body', s)(n) THEN (iterate_while(min[nat] (while_termination_point?(b_ex', body', s)), b_ex', body') ## e2s(b_ex') ## catch_break) (s) ELSE Hang ENDIF)) ## catch_break ELSE λ (s: State): OK(s) ENDIF)) (x')) </pre>
--	--

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of while_as_if_while.1.2.2.

while_as_if_while.2:

<pre> {1} ∃ (b: bool): b ⊃ (∃ (s: State): (∃ (n: nat): while_termination_point?(b_ex', body', s)(n)) ⊃ nonempty?[nat](while_termination_point?(b_ex', body', s))) </pre>	
--	--

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of while_as_if_while.2.

while_as_if_while.3:

$$\{1\} \quad \forall (s: \text{State}):$$

$$\quad (\exists (n: \text{nat}): \text{while_termination_point?}(b_ex', \text{body}', s)(n)) \supset$$

$$\quad \text{nonempty?}[\text{nat}](\text{while_termination_point?}(b_ex', \text{body}', s))$$

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of `while_as_if_while.3`.
 Q.E.D.

C.107.7 IterationStatements1.iterate_do_as_while

Terse proof for `iterate_do_as_while`.

`iterate_do_as_while`:

$$\{1\} \quad \forall (b_ex: [\text{State} \rightarrow \text{ExprResult}[\text{State}, \text{bool}]], \text{body}: [\text{State} \rightarrow \text{StmtResult}[\text{State}]],$$

$$\quad n: \text{nat}):$$

$$\quad \text{iterate_do}(n, \text{body}, b_ex) = (\text{body} \## \text{catch_continue} \## \text{iterate_while}(n, b_ex, \text{body}))$$

Inducting on n on formula 1,
 we get 2 subgoals:

`iterate_do_as_while.1`:

$$\{1\} \quad \forall (b_ex: [\text{State} \rightarrow \text{ExprResult}[\text{State}, \text{bool}]], \text{body}: [\text{State} \rightarrow \text{StmtResult}[\text{State}]]):$$

$$\quad \text{iterate_do}(0, \text{body}, b_ex) = (\text{body} \## \text{catch_continue} \## \text{iterate_while}(0, b_ex, \text{body}))$$

Repeatedly Skolemizing and flattening,
 Applying decompose-equality,
 Trying repeated skolemization, instantiation, and if-lifting,
 Applying decompose-equality,
 This completes the proof of `iterate_do_as_while.1`.

`iterate_do_as_while.2`:

$$\{1\} \quad \forall j:$$

$$\quad (\forall (b_ex: [\text{State} \rightarrow \text{ExprResult}[\text{State}, \text{bool}]], \text{body}: [\text{State} \rightarrow \text{StmtResult}[\text{State}]]):$$

$$\quad \quad \text{iterate_do}(j, \text{body}, b_ex) =$$

$$\quad \quad (\text{body} \## \text{catch_continue} \## \text{iterate_while}(j, b_ex, \text{body})))$$

$$\quad \supset$$

$$\quad (\forall (b_ex: [\text{State} \rightarrow \text{ExprResult}[\text{State}, \text{bool}]], \text{body}: [\text{State} \rightarrow \text{StmtResult}[\text{State}]]):$$

$$\quad \quad \text{iterate_do}(j + 1, \text{body}, b_ex) =$$

$$\quad \quad (\text{body} \## \text{catch_continue} \## \text{iterate_while}(j + 1, b_ex, \text{body})))$$

Repeatedly Skolemizing and flattening,
 Expanding the definition of `iterate_do`,
 Expanding the definition of `iterate_while`,
 Applying decompose-equality,
 Instantiating quantified variables,
 Replacing using formula -2,

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of `iterate_do_as_while.2`.
 Q.E.D.

C.107.8 IterationStatements1.do_termination_point?_TCC1

Terse proof for `do_termination_point?_TCC1`.

`do_termination_point?_TCC1`:

$\{1\} \quad \forall (\text{body}: [\text{State} \rightarrow \text{StmtResult}[\text{State}]], \text{b_ex}: [\text{State} \rightarrow \text{ExprResult}[\text{State}, \text{bool}]],$ $s: \text{State}, n: \text{nat}, \text{res}: \text{StmtResult}[\text{State}]):$ $\text{OK?}(\text{res}) \wedge \text{res} = \text{iterate_do}(n, \text{body}, \text{b_ex})(s) \supset$ $\text{OK?}[\text{State}](\text{res}) \vee$ $\text{Break?}[\text{State}](\text{res}) \vee$ $\text{Continue?}[\text{State}](\text{res}) \vee$ $\text{Return?}[\text{State}](\text{res}) \vee$ $\text{Switch?}[\text{State}](\text{res}) \vee \text{Default?}[\text{State}](\text{res}) \vee \text{Exception?}[\text{State}](\text{res})$

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of `do_termination_point?_TCC1`.
 Q.E.D.

C.107.9 IterationStatements1.termination_point_do_as_while_TCC1

Terse proof for `termination_point_do_as_while_TCC1`.

`termination_point_do_as_while_TCC1`:

$\{1\} \quad \forall (\text{body}: [\text{State} \rightarrow \text{StmtResult}[\text{State}]], s: \text{State}):$ $\text{OK?}((\text{body} \ \#\# \ \text{catch_continue})(s)) \supset$ $\text{OK?}[\text{State}]((\#\# [\text{State}] (\text{body}, \text{catch_continue}[\text{State}])(s)) \vee$ $\text{Break?}[\text{State}]((\#\# [\text{State}] (\text{body}, \text{catch_continue}[\text{State}])(s)) \vee$ $\text{Continue?}[\text{State}]((\#\# [\text{State}] (\text{body}, \text{catch_continue}[\text{State}])(s)) \vee$ $\text{Return?}[\text{State}]((\#\# [\text{State}] (\text{body}, \text{catch_continue}[\text{State}])(s)) \vee$ $\text{Switch?}[\text{State}]((\#\# [\text{State}] (\text{body}, \text{catch_continue}[\text{State}])(s)) \vee$ $\text{Default?}[\text{State}]((\#\# [\text{State}] (\text{body}, \text{catch_continue}[\text{State}])(s)) \vee$ $\text{Exception?}[\text{State}]((\#\# [\text{State}] (\text{body}, \text{catch_continue}[\text{State}])(s))$

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of `termination_point_do_as_while_TCC1`.
 Q.E.D.

C.107.10 IterationStatements1.termination_point_do_as_while

Terse proof for `termination_point_do_as_while`.

termination_point_do_as_while:

$$\{1\} \quad \forall (b_ex: [State \rightarrow ExprResult [State, bool]], \text{body}: [State \rightarrow StmtResult [State]]), \\ s: State): \\ OK?((\text{body} \ \#\# \ \text{catch_continue})(s)) \supset \\ \text{do_termination_point?}(\text{body}, b_ex, s) = \\ \text{while_termination_point?}(b_ex, \text{body}, \text{state}((\text{body} \ \#\# \ \text{catch_continue})(s)))$$

Repeatedly Skolemizing and flattening,
 Applying decompose-equality,
 Expanding the definition of do_termination_point?,
 Expanding the definition of while_termination_point?,
 Rewriting using iterate_do_as_while, matching in *,
 Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of termination_point_do_as_while.
 Q.E.D.

C.107.11 IterationStatements1.do_while_TCC1

Terse proof for do_while_TCC1.

do_while_TCC1:

$$\{1\} \quad \forall (\text{body}: [State \rightarrow StmtResult [State]], b_ex: [State \rightarrow ExprResult [State, bool]], \\ s: State): \\ (\exists (n: \text{nat}): \text{do_termination_point?}(\text{body}, b_ex, s)(n)) \supset \\ \text{nonempty?}[\text{nat}](\text{do_termination_point?}(\text{body}, b_ex, s))$$

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of do_while_TCC1.
 Q.E.D.

C.107.12 IterationStatements1.do_as_while

Terse proof for do_as_while.

do_as_while:

$$\{1\} \quad \forall (b_ex: [State \rightarrow ExprResult [State, bool]], \text{body}: [State \rightarrow StmtResult [State]]): \\ \text{do_while}(\text{body}, b_ex) = (\text{body} \ \#\# \ \text{catch_continue} \ \#\# \ \text{while}(b_ex, \text{body}) \ \#\# \ \text{catch_break})$$

Repeatedly Skolemizing and flattening,
 Expanding the definition of do_while,
 Expanding the definition of while,
 Applying decompose-equality,
 we get 3 subgoals:

do_as_while.1:

```

{1} IF  $\exists (n: \text{nat}): \text{do\_termination\_point?}(\text{body}', \text{b\_ex}', x')(n)$ 
    THEN  $(\text{iterate\_do}(\text{min}[\text{nat}](\text{do\_termination\_point?}(\text{body}', \text{b\_ex}', x')), \text{body}', \text{b\_ex}')$ 
         $\text{## e2s}(\text{b\_ex}')$ 
         $\text{## catch\_break}$ 
         $(x')$ 
    ELSE Hang
    ENDIF
    =
     $((\text{body}' \text{## catch\_continue} \text{##}$ 
         $(\lambda (s: \text{State}):$ 
            IF  $\exists (n: \text{nat}): \text{while\_termination\_point?}(\text{b\_ex}', \text{body}', s)(n)$ 
                THEN  $(\text{iterate\_while}(\text{min}[\text{nat}](\text{while\_termination\_point?}(\text{b\_ex}', \text{body}', s)),$ 
                     $\text{b\_ex}', \text{body}')$ 
                     $\text{## e2s}(\text{b\_ex}')$ 
                     $\text{## catch\_break}$ 
                     $(s)$ 
                ELSE Hang
                ENDIF))
         $\text{## catch\_break}$ 
         $(x')$ 

```

Installing automatic rewrites from: (iterate_do_as_while! termination_point_do_as_while!)

Case splitting on $\text{OK?}((\text{body}'1 \text{## catch_continue})(x'1))$,

we get 2 subgoals:

do_as_while.1.1:

```

{-1} OK? $((\text{body}' \text{## catch\_continue})(x'))$ 
{1} IF  $\exists (n: \text{nat}): \text{do\_termination\_point?}(\text{body}', \text{b\_ex}', x')(n)$ 
    THEN  $(\text{iterate\_do}(\text{min}[\text{nat}](\text{do\_termination\_point?}(\text{body}', \text{b\_ex}', x')), \text{body}', \text{b\_ex}')$

         $\text{## catch\_break}$ 
         $(x')$ 
    ELSE Hang
    ENDIF
    =
     $((\text{body}' \text{## catch\_continue} \text{##}$ 
         $(\lambda (s: \text{State}):$ 
            IF  $\exists (n: \text{nat}): \text{while\_termination\_point?}(\text{b\_ex}', \text{body}', s)(n)$ 
                THEN  $(\text{iterate\_while}(\text{min}[\text{nat}](\text{while\_termination\_point?}(\text{b\_ex}', \text{body}', s)),$ 
                     $\text{b\_ex}', \text{body}')$ 
                     $\text{## e2s}(\text{b\_ex}')$ 
                     $\text{## catch\_break}$ 
                     $(s)$ 
                ELSE Hang
                ENDIF))
         $\text{## catch\_break}$ 
         $(x')$ 

```

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of do_as_while.1.1.

do_as_while.1.2:

<pre> {1} OK?((body' ## catch_continue)(x')) {2} IF ∃ (n: nat): do_termination_point?(body', b_ex', x')(n) THEN (iterate_do(min[nat](do_termination_point?(body', b_ex', x')), body', b_ex') ## e2s(b_ex') ## catch_break) (x') ELSE Hang ENDIF = ((body' ## catch_continue ## (λ (s: State): IF ∃ (n: nat): while_termination_point?(b_ex', body', s)(n) THEN (iterate_while(min[nat](while_termination_point?(b_ex', body', s)), b_ex', body') ## e2s(b_ex') ## catch_break) (s) ELSE Hang ENDIF)) ## catch_break) (x') </pre>
--

Trying repeated skolemization, instantiation, and if-lifting,
we get 2 subgoals:

do_as_while.1.2.1:

<pre> {-1} Break?(body'(x')) {1} ∃ (n: nat): do_termination_point?(body', b_ex', x')(n) </pre>
--

Instantiating the top quantifier in 1 with the terms: 0,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of do_as_while.1.2.1.

do_as_while.1.2.2:

<pre> {1} Continue?(body'(x')) {2} OK?(body'(x')) {3} ∃ (n: nat): do_termination_point?(body', b_ex', x')(n) {4} Hang?(body'(x')) </pre>
--

Instantiating the top quantifier in 3 with the terms: 0,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of do_as_while.1.2.2.

do_as_while.2:

<pre> {1} ∀ (s: State): (∃ (n: nat): while_termination_point?(b_ex', body', s)(n)) ⊃ nonempty?[nat](while_termination_point?(b_ex', body', s)) </pre>

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of do_as_while.2.

do_as_while.3:

{1} $\forall (s: \text{State}):$
 $(\exists (n: \text{nat}): \text{do_termination_point?}(\text{body}', \text{b_ex}', s)(n)) \supset$
 $\text{nonempty?}[\text{nat}](\text{do_termination_point?}(\text{body}', \text{b_ex}', s))$

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of do_as_while.3.
 Q.E.D.

C.107.13 IterationStatements1.do_while_unroll

Terse proof for do_while_unroll.

do_while_unroll:

{1} $\forall (\text{b_ex}: [\text{State} \rightarrow \text{ExprResult}[\text{State}, \text{bool}]], \text{body}: [\text{State} \rightarrow \text{StmtResult}[\text{State}]],$
 $\text{max}: \text{nat}):$
 $\text{do_while}(\text{max}, \text{body}, \text{b_ex}) =$
 $(\text{body} \ \#\# \ \text{catch_continue} \ \#\# \ \text{while}(\text{max}, \text{b_ex}, \text{body}) \ \#\# \ \text{catch_break})$

Repeatedly Skolemizing and flattening,
 Expanding the definition of do_while,
 Expanding the definition of while,
 Rewriting using do_as_while, matching in *,
 This completes the proof of do_while_unroll.
 Q.E.D.

C.108 Proofs for IterationStatements2 (statements.pvs)

C.108.1 IterationStatements2.iterate_for_TCC1

Terse proof for iterate_for_TCC1.

iterate_for_TCC1:

{1} $\forall (n: \text{nat}, s: \text{State}): \neg n = 0 \supset n - 1 \geq 0$

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of iterate_for_TCC1.
 Q.E.D.

C.108.2 IterationStatements2.iterate_for_TCC2

Terse proof for iterate_for_TCC2.

iterate_for_TCC2:

{1} $\forall (n: \text{nat}, s: \text{State}): \neg n = 0 \supset n - 1 < n$

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of iterate_for_TCC2.
 Q.E.D.

C.108.3 IterationStatements2.iterate_for_as_while_TCC1

Terse proof for `iterate_for_as_while_TCC1`.

`iterate_for_as_while_TCC1:`

$\{1\} \quad \forall (n: \text{nat}): n > 0 \supset n - 1 \geq 0$

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `iterate_for_as_while_TCC1`.

Q.E.D.

C.108.4 IterationStatements2.iterate_for_as_while

Terse proof for `iterate_for_as_while`.

`iterate_for_as_while:`

$\{1\} \quad \forall (b_ex: [\text{State} \rightarrow \text{ExprResult}[\text{State}, \text{bool}]], \text{body}: [\text{State} \rightarrow \text{StmtResult}[\text{State}]],$ $\quad \text{expr}: [\text{State} \rightarrow \text{ExprResult}[\text{State}, \text{ExprData}]], n: \text{nat}):$ $\quad n > 0 \supset$ $\quad \text{iterate_for}(n, b_ex, \text{expr}, \text{body}) =$ $\quad (\text{e2s}(b_ex) \## \text{body} \## \text{catch_continue} \## \text{iterate_while}(n - 1, \text{expr} \## b_ex, \text{body})$ $\quad \## \text{e2s}(\text{expr}))$
--

Inducting on n on formula 1,

we get 3 subgoals:

`iterate_for_as_while.1:`

$\{1\} \quad \forall (b_ex: [\text{State} \rightarrow \text{ExprResult}[\text{State}, \text{bool}]], \text{body}: [\text{State} \rightarrow \text{StmtResult}[\text{State}]],$ $\quad \text{expr}: [\text{State} \rightarrow \text{ExprResult}[\text{State}, \text{ExprData}]]):$ $\quad 0 > 0 \supset$ $\quad \text{iterate_for}(0, b_ex, \text{expr}, \text{body}) =$ $\quad (\text{e2s}(b_ex) \## \text{body} \## \text{catch_continue} \## \text{iterate_while}(0 - 1, \text{expr} \## b_ex, \text{body}) \##$ $\quad \text{e2s}(\text{expr}))$

Simplifying, rewriting, and recording with decision procedures,

This completes the proof of `iterate_for_as_while.1`.

iterate_for_as_while.2:

<pre> {1} ∀ j: (∀ (b_ex: [State → ExprResult[State, bool]], body: [State → StmtRe- sult[State]], expr: [State → ExprResult[State, ExprData]]): j > 0 ⊃ iterate_for(j, b_ex, expr, body) = (e2s(b_ex) ## body ## catch_continue ## iterate_while(j - 1, expr ## b_ex, body) ## e2s(expr))) ⊃ (∀ (b_ex: [State → ExprResult[State, bool]], body: [State → StmtRe- sult[State]], expr: [State → ExprResult[State, ExprData]]): j + 1 > 0 ⊃ iterate_for(j + 1, b_ex, expr, body) = (e2s(b_ex) ## body ## catch_continue ## iterate_while(j + 1 - 1, expr ## b_ex, body) ## e2s(expr))) </pre>
--

Repeatedly Skolemizing and flattening,

Instantiating quantified variables,

Applying decompose-equality,

Case splitting on $j!1 = 0$,

we get 2 subgoals:

iterate_for_as_while.2.1:

<pre> {-1} j' = 0 {-2} j' ≥ 0 {-3} j' > 0 ⊃ iterate_for(j', b_ex', expr', body') = (e2s(b_ex') ## body' ## catch_continue ## iterate_while(j' - 1, expr' ## b_ex', body') ## e2s(expr')) {-4} 1 + j' > 0 </pre>
<hr/> <pre> {1} iterate_for(1 + j', b_ex', expr', body')(x') = (e2s(b_ex') ## body' ## catch_continue ## iterate_while(j', expr' ## b_ex', body') ## e2s(expr')) (x') </pre>

Replacing using formula -1,

Keeping (1) and hiding *,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `iterate_for_as_while.2.1`.

iterate_for_as_while.2.2:

<pre> {-1} j' ≥ 0 {-2} j' > 0 ⊃ iterate_for(j', b_ex', expr', body') = (e2s(b_ex') ## body' ## catch_continue ## iterate_while(j' - 1, expr' ## b_ex', body') ## e2s(expr')) {-3} 1 + j' > 0 </pre>	<pre> {1} j' = 0 {2} iterate_for(1 + j', b_ex', expr', body')(x') = (e2s(b_ex') ## body' ## catch_continue ## iterate_while(j', expr' ## b_ex', body') ## e2s(expr')) (x') </pre>
--	--

Simplifying, rewriting, and recording with decision procedures,

Expanding the definition of iterate_for,

Expanding the definition of iterate_while,

Replacing using formula -2,

Keeping (2) and hiding *,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of iterate_for_as_while.2.2.

iterate_for_as_while.3:

<pre> {1} ∀ (n: nat): n > 0 ⊃ n - 1 ≥ 0 {2} ∀ (b_ex: [State → ExprResult[State, bool]], body: [State → StmtResult[State]], expr: [State → ExprResult[State, ExprData]]): n' > 0 ⊃ iterate_for(n', b_ex, expr, body) = (e2s(b_ex) ## body ## catch_continue ## iterate_while(n' - 1, expr ## b_ex, body) ## e2s(expr)) </pre>	
--	--

Hiding formulas: 2,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of iterate_for_as_while.3.

Q.E.D.

C.108.5 IterationStatements2.for_termination_point?_TCC1

Terse proof for for_termination_point?_TCC1.

for_termination_point?_TCC1:

<pre> {1} ∀ (b_ex: [State → ExprResult[State, bool]], expr: [State → ExprResult[State, ExprData]], body: [State → StmtRe- sult[State]], s: State, n: nat, res: StmtResult[State]): OK?(res) ∧ res = iterate_for(n, b_ex, expr, body)(s) ⊃ OK?[State](res) ∨ Break?[State](res) ∨ Continue?[State](res) ∨ Return?[State](res) ∨ Switch?[State](res) ∨ Default?[State](res) ∨ Exception?[State](res) </pre>	
--	--

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of `for_termination_point?_TCC1`.
 Q.E.D.

C.108.6 IterationStatements2.termination_point_for_as_while_TCC1

Terse proof for `termination_point_for_as_while_TCC1`.

`termination_point_for_as_while_TCC1`:

```

{1}  ∃ (b_ex: [State → ExprResult[State, bool]], body: [State → StmtResult[State]],
      s: State, n: nat):
  n > 0 ∧ OK?((e2s(b_ex) ## body ## catch_continue)(s)) ⊃

Q.E.D.

C.108.15 IterationStatements2.for_unroll

Terse proof for `for_unroll`.

for_unroll:

$\{1\} \quad \forall (b_ex: [State \rightarrow ExprResult[State, bool]], body: [State \rightarrow StmtResult[State]],$ $\quad expr: [State \rightarrow ExprResult[State, ExprData]], init: [State \rightarrow StmtResult[State]],$ $\quad max: nat):$ $\quad for(max, init, b_ex, expr, body) =$ $\quad (init \##$ $\quad \quad if_else(b_ex, body \## catch_continue \## while(max, expr \## b_ex, body) \## catch_break,$ $\quad \quad \quad skip))$

Repeatedly Skolemizing and flattening,
 Expanding the definition of for,
 Expanding the definition of while,
 Rewriting using for_as_while, matching in *,
 This completes the proof of for_unroll.
 Q.E.D.

C.109 Proofs for IterationStatements3 (statements.pvs)

C.109.1 IterationStatements3.do_while_inv_unroll

Terse proof for do_while_inv_unroll.

do_while_inv_unroll:

$\{1\} \quad \forall (<: PRED[[Ord, Ord]], P, Q, R: [State \rightarrow PRED[StmtResult[State]]],$ $\quad b_ex: [State \rightarrow ExprResult[State, bool]], body: [State \rightarrow StmtResult[State]],$ $\quad variant: [State \rightarrow [State \rightarrow Ord]]):$ $\quad do_while(body, b_ex)(P, Q, R, variant, <) =$ $\quad (body \## catch_continue \## while(b_ex, body)(P, Q, R, variant, <) \## catch_break)$

Repeatedly Skolemizing and flattening,
 Expanding the definition of do_while,
 Expanding the definition of while,
 Rewriting using do_as_while, matching in *,
 This completes the proof of do_while_inv_unroll.
 Q.E.D.

C.110 Proofs for IterationStatements4 (statements.pvs)

C.110.1 IterationStatements4.for_inv_unroll

Terse proof for for_inv_unroll.

for_inv_unroll:

```

{1}  ∀ (<: PRED[[Ord, Ord]], P, Q, R: [State → PRED[StmtResult[State]]],
      b_ex: [State → ExprResult[State, bool]], body: [State → StmtRe-
sult[State]],
      expr: [State → ExprResult[State, ExprData]], init: [State → StmtRe-
sult[State]],
      variant: [State → [State → Ord]]):
for(init, b_ex, expr, body)(P, Q, R, variant, <) =
  (init ##
   if_else(b_ex,
            body ## catch_continue ## while(expr ## b_ex, body)(P, Q, R, vari-
ant, <) ##
            catch_break,
            skip))

```

Repeatedly Skolemizing and flattening,
Expanding the definition of for,
Expanding the definition of while,
Rewriting using for_as_while, matching in *,
This completes the proof of for_inv_unroll.

This theory contains no provable formal statements.

C.114 Proofs for Linear_Memory (linear_memory.pvs)

C.114.1 Linear_Memory.xlat_idx_TCC1

Terse proof for xlat_idx_TCC1.

xlat_idx_TCC1:

```

{1}  ∀ (lvl: Level, base, addr: Memory_Address_4G): offset(addr) ≥ 0

```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of xlat_idx_TCC1.
Q.E.D.

C.114.2 Linear_Memory.xlat_idx_TCC2

Terse proof for xlat_idx_TCC2.

xlat_idx_TCC2:

$$\{1\} \quad \forall (lvl: \text{Level}, \text{base}, \text{addr}: \text{Memory_Address_4G}):$$

$$\text{bus_width} - (lvl + 1) \times \text{bits_per_level} \geq 0$$

Trying repeated skolemization, instantiation, and if-lifting,

Using lemma bus_width,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of xlat_idx_TCC2.

Q.E.D.

C.114.3 Linear_Memory.xlat_idx_pe_aligned_TCC1

Terse proof for xlat_idx_pe_aligned_TCC1.

xlat_idx_pe_aligned_TCC1:

$$\{1\} \quad \forall (lvl: \text{Level}, \text{base}, \text{addr}: \text{Memory_Address_4G}): \text{offset}(\text{base}) \geq 0$$

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of xlat_idx_pe_aligned_TCC1.

Q.E.D.

C.114.4 Linear_Memory.xlat_idx_pe_aligned_TCC2

Terse proof for xlat_idx_pe_aligned_TCC2.

xlat_idx_pe_aligned_TCC2:

$$\{1\} \quad \forall (lvl: \text{Level}, \text{base}, \text{addr}: \text{Memory_Address_4G}):$$

$$\text{aligned?}(\text{bits_per_level} + \text{pe_size})(\text{offset}(\text{base})) \supset$$

$$\text{offset}(\text{xlat_idx}(lvl, \text{base}, \text{addr})) \geq 0$$

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of xlat_idx_pe_aligned_TCC2.

Q.E.D.

C.114.5 Linear_Memory.xlat_idx_pe_aligned

Terse proof for xlat_idx_pe_aligned.

xlat_idx_pe_aligned:

$$\{1\} \quad \forall (lvl: \text{Level}, \text{base}, \text{addr}: \text{Memory_Address_4G}):$$

$$\text{aligned?}(\text{bits_per_level} + \text{pe_size})(\text{offset}(\text{base})) \supset$$

$$\text{aligned?}(\text{pe_size})(\text{offset}(\text{xlat_idx}(lvl, \text{base}, \text{addr})))$$

Repeatedly Skolemizing and flattening,

Expanding the definition of xlat_idx,

Installing automatic rewrites from: (bus_width! bits_per_level! max_level!)

Case splitting on $-1 * (\text{bits_per_level} * lvl!1) - \text{bits_per_level} + \text{bus_width} \geq 0$,

we get 2 subgoals:

C Proof scripts

xlat_idx_pe_aligned.1:

{-1}	$-1 \times (\text{bits_per_level} \times \text{lvl}') - \text{bits_per_level} + \text{bus_width} \geq 0$
{-2}	$\text{lvl}' < \text{max_level}$
{-3}	$\text{Mem?}(\text{base}'\text{'type_of})$
{-4}	$0 \leq \text{base}'\text{'offset}$
{-5}	$\text{base}'\text{'offset} < \text{max_linear_offset}$
{-6}	$\text{Mem?}(\text{addr}'\text{'type_of})$
{-7}	$0 \leq \text{addr}'\text{'offset}$
{-8}	$\text{addr}'\text{'offset} < \text{max_linear_offset}$
{-9}	$\text{aligned?}(\text{bits_per_level} + \text{pe_size})(\text{offset}(\text{base}'))$
{1}	$\text{aligned?}(\text{pe_size})$ $(\text{offset}(\text{base}' + \text{shift_bits_left}(\text{cut_bits}(\text{offset}(\text{addr}')), -1 \times \text{bits_per_level} \times \text{lvl}' - \text{bits_per_level}))$

Using lemma aligned_shift_bits_ok,

we get 2 subgoals:

xlat_idx_pe_aligned.1.1:

{-1}	$\text{pe_size} \leq \text{pe_size} \supset$ $\text{aligned?}(\text{pe_size})$ $(\text{shift_bits_left}(\text{cut_bits}(\text{offset}(\text{addr}')),$ $\text{bus_width} - (\text{lvl}' + 1) \times \text{bits_per_level},$ $\text{bits_per_level}),$ $\text{pe_size}))$
{-2}	$-1 \times (\text{bits_per_level} \times \text{lvl}') - \text{bits_per_level} + \text{bus_width} \geq 0$
{-3}	$\text{lvl}' < \text{max_level}$
{-4}	$\text{Mem?}(\text{base}'\text{'type_of})$
{-5}	$0 \leq \text{base}'\text{'offset}$
{-6}	$\text{base}'\text{'offset} < \text{max_linear_offset}$
{-7}	$\text{Mem?}(\text{addr}'\text{'type_of})$
{-8}	$0 \leq \text{addr}'\text{'offset}$
{-9}	$\text{addr}'\text{'offset} < \text{max_linear_offset}$
{-10}	$\text{aligned?}(\text{bits_per_level} + \text{pe_size})(\text{offset}(\text{base}'))$
{1}	$\text{aligned?}(\text{pe_size})$ $(\text{offset}(\text{base}' + \text{shift_bits_left}(\text{cut_bits}(\text{offset}(\text{addr}')), -1 \times \text{bits_per_level} \times \text{lvl}' - \text{bits_per_level}))$

Expanding the definition of +,

Using lemma aligned_plus,

we get 4 subgoals:

xlat_idx_pe_aligned.1.1.1:

{-1}	aligned?(min(bits_per_level + pe_size, pe_size)) (offset(base') + shift_bits_left(cut_bits(offset(addr'), bus_width - (lvl' + 1) × bits_per_level, bits_per_level),
{-2}	pe_size ≤ pe_size ⊃ aligned?(pe_size) (shift_bits_left(cut_bits(offset(addr'), bus_width - (lvl' + 1) × bits_per_level, bits_per_level), pe_size))
{-3}	-1 × (bits_per_level × lvl') - bits_per_level + bus_width ≥ 0
{-4}	lvl' < max_level
{-5}	Mem?(base' type_of)
{-6}	0 ≤ base' offset
{-7}	base' offset < max_linear_offset
{-8}	Mem?(addr' type_of)
{-9}	0 ≤ addr' offset
{-10}	addr' offset < max_linear_offset
{-11}	aligned?(bits_per_level + pe_size)(offset(base'))
{1}	aligned?(pe_size) (base' offset + shift_bits_left(cut_bits(offset(addr'), -1 × bits_per_level × lvl' - bits_per_level + bus_width,

Expanding the definition of min,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of xlat_idx_pe_aligned.1.1.1.

xlat_idx_pe_aligned.1.1.2:

{-1}	pe_size ≤ pe_size ⊃ aligned?(pe_size) (shift_bits_left(cut_bits(offset(addr'), bus_width - (lvl' + 1) × bits_per_level, bits_per_level), pe_size))
{-2}	-1 × (bits_per_level × lvl') - bits_per_level + bus_width ≥ 0
{-3}	lvl' < max_level
{-4}	Mem?(base' type_of)
{-5}	0 ≤ base' offset
{-6}	base' offset < max_linear_offset
{-7}	Mem?(addr' type_of)
{-8}	0 ≤ addr' offset
{-9}	addr' offset < max_linear_offset
{-10}	aligned?(bits_per_level + pe_size)(offset(base'))
{1}	aligned?(pe_size) (shift_bits_left(cut_bits(offset(addr'), 22 - 10 × lvl', 10), pe_size))
{2}	aligned?(pe_size) (base' offset + shift_bits_left(cut_bits(offset(addr'), -1 × bits_per_level × lvl' - bits_per_level + bus_width,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of xlat_idx_pe_aligned.1.1.2.

C Proof scripts

xlat_idx_pe_aligned.1.1.3:

{-1}	$pe_size \leq pe_size \supset$ $aligned?(pe_size)$ $(shift_bits_left(cut_bits(offset(addr'),$ $bus_width - (lvl' + 1) \times bits_per_level,$ $bits_per_level),$ $pe_size))$
{-2}	$-1 \times (bits_per_level \times lvl') - bits_per_level + bus_width \geq 0$
{-3}	$lvl' < max_level$
{-4}	$Mem?(base' \text{ 'type_of})$
{-5}	$0 \leq base' \text{ 'offset}$
{-6}	$base' \text{ 'offset} < max_linear_offset$
{-7}	$Mem?(addr' \text{ 'type_of})$
{-8}	$0 \leq addr' \text{ 'offset}$
{-9}	$addr' \text{ 'offset} < max_linear_offset$
{-10}	$aligned?(bits_per_level + pe_size)(offset(base'))$
{1}	$22 - 10 \times lvl' \geq 0$
{2}	$aligned?(pe_size)$ $(base' \text{ 'offset} + shift_bits_left(cut_bits(offset(addr'), -1 \times bits_per_level \times lvl' - bits_per_level))$

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of xlat_idx_pe_aligned.1.1.3.

xlat_idx_pe_aligned.1.1.4:

{-1}	$pe_size \leq pe_size \supset$ $aligned?(pe_size)$ $(shift_bits_left(cut_bits(offset(addr'),$ $bus_width - (lvl' + 1) \times bits_per_level,$ $bits_per_level),$ $pe_size))$
{-2}	$-1 \times (bits_per_level \times lvl') - bits_per_level + bus_width \geq 0$
{-3}	$lvl' < max_level$
{-4}	$Mem?(base' \text{ 'type_of})$
{-5}	$0 \leq base' \text{ 'offset}$
{-6}	$base' \text{ 'offset} < max_linear_offset$
{-7}	$Mem?(addr' \text{ 'type_of})$
{-8}	$0 \leq addr' \text{ 'offset}$
{-9}	$addr' \text{ 'offset} < max_linear_offset$
{-10}	$aligned?(bits_per_level + pe_size)(offset(base'))$
{1}	$aligned?(10 + pe_size)(offset(base'))$
{2}	$aligned?(pe_size)$ $(base' \text{ 'offset} + shift_bits_left(cut_bits(offset(addr'), -1 \times bits_per_level \times lvl' - bits_per_level))$

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of xlat_idx_pe_aligned.1.1.4.

xlat_idx_pe_aligned.1.2:

<pre> {-1} -1 × (bits_per_level × lvl') - bits_per_level + bus_width ≥ 0 {-2} lvl' < max_level {-3} Mem?(base' type_of) {-4} 0 ≤ base' offset {-5} base' offset < max_linear_offset {-6} Mem?(addr' type_of) {-7} 0 ≤ addr' offset {-8} addr' offset < max_linear_offset {-9} aligned?(bits_per_level + pe_size)(offset(base')) </pre>	<hr/> <pre> {1} 22 - 10 × lvl' ≥ 0 {2} aligned?(pe_size) (offset (base' + shift_bits_left(cut_bits(offset(addr')), -1 × bits_per_level × lvl' - bits_per_level + bus_wi </pre>
--	--

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of xlat_idx_pe_aligned.1.2.

xlat_idx_pe_aligned.2:

<pre> {-1} lvl' < max_level {-2} Mem?(base' type_of) {-3} 0 ≤ base' offset {-4} base' offset < max_linear_offset {-5} Mem?(addr' type_of) {-6} 0 ≤ addr' offset {-7} addr' offset < max_linear_offset {-8} aligned?(bits_per_level + pe_size)(offset(base')) </pre>	<hr/> <pre> {1} -1 × (bits_per_level × lvl') - bits_per_level + bus_width ≥ 0 {2} aligned?(pe_size) (offset (base' + shift_bits_left(cut_bits(offset(addr')), -1 × bits_per_level × lvl' - bits_per_level + bus_wi </pre>
--	---

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of xlat_idx_pe_aligned.2.
Q.E.D.

C.114.6 Linear_Memory.xlat_idx_memory_address

Terse proof for xlat_idx_memory_address.

xlat_idx_memory_address:

<pre> {1} ∀ (lvl: Level, base, addr: Memory_Address_4G): aligned?(bits_per_level + pe_size)(offset(base)) ⊃ xlat_idx(lvl, base, addr) < max_linear </pre>

Repeatedly Skolemizing and flattening,
Installing automatic rewrites from: Mem + < max_linear max_linear_offset bits_per_level pe_size
max_level bus_width

Expanding the definition of xlat_idx,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Using lemma aligned_add_below,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Rewriting using shift_bits_left_less, matching in *,

This completes the proof of `xlat_idx_memory_address`.
 Q.E.D.

C.114.7 Linear_Memory.xlat_idx_memory_address2

Terse proof for `xlat_idx_memory_address2`.

`xlat_idx_memory_address2`:

<pre>{1} ∀ (lvl: Level, base, addr: Memory_Address_4G): aligned?(bits_per_level + pe_size)(offset(base)) ⊃ 0 ≤ offset(xlat_idx(lvl, base, addr))</pre>

Expanding the definition of `xlat_idx`,
 Repeatedly Skolemizing and flattening,
 Adding type constraints for `shift_bits_left(cut_bits(offset(addr!1), -1 * (lvl!1 * bits_per_level) - bits_per_level + bus_width, bits_per_level), pe_size)`,
 we get 2 subgoals:

`xlat_idx_memory_address2.1`:

<pre>{-1} shift_bits_left(cut_bits(offset(addr'), -1 × (lvl' × bits_per_level) - bits_per_level + bus_width, bits_per_level), pe_size) ≥ 0 {-2} lvl' < max_level {-3} Mem?(base', type_of) {-4} 0 ≤ base' offset {-5} base' offset < max_linear_offset {-6} Mem?(addr', type_of) {-7} 0 ≤ addr' offset {-8} addr' offset < max_linear_offset {-9} aligned?(bits_per_level + pe_size)(offset(base'))</pre>
<pre>{1} 0 ≤ offset (base' + shift_bits_left(cut_bits(offset(addr'), -1 × lvl' × bits_per_level - bits_per_level + bus_w</pre>

Expanding the definition of `+`,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 This completes the proof of `xlat_idx_memory_address2.1`.

`xlat_idx_memory_address2.2`:

<pre>{-1} lvl' < max_level {-2} Mem?(base', type_of) {-3} 0 ≤ base' offset {-4} base' offset < max_linear_offset {-5} Mem?(addr', type_of) {-6} 0 ≤ addr' offset {-7} addr' offset < max_linear_offset {-8} aligned?(bits_per_level + pe_size)(offset(base'))</pre>
<pre>{1} -1 × (lvl' × bits_per_level) - bits_per_level + bus_width ≥ 0 {2} 0 ≤ offset (base' + shift_bits_left(cut_bits(offset(addr'), -1 × lvl' × bits_per_level - bits_per_level + bus_w</pre>

Keeping (-1 1) and hiding *,
 Trying repeated skolemization, instantiation, and if-lifting,
 Expanding the definition of bus_width,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 This completes the proof of xlat_idx_memory_address2.2.
 Q.E.D.

C.114.8 Linear_Memory.xlat_ofs_memory_address

Terse proof for xlat_ofs_memory_address.

xlat_ofs_memory_address:

$$\{1\} \quad \forall (lvl: \text{Level}, \text{base}, \text{addr}: \text{Memory_Address_4G}):$$

$$\text{aligned?}(\text{bus_width} - (lvl + 1) \times \text{bits_per_level})(\text{offset}(\text{base})) \supset$$

$$\text{xlat_ofs}(lvl, \text{base}, \text{addr}) < \text{max_linear}$$

Installing automatic rewrites from: Mem + < max_linear max_linear_offset bits_per_level pe_size
 max_level bus_width

Repeatedly Skolemizing and flattening,
 Expanding the definition of xlat_ofs,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 Using lemma aligned_add_below,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 This completes the proof of xlat_ofs_memory_address.
 Q.E.D.

C.114.9 Linear_Memory.xlat_ofs_memory_address2

Terse proof for xlat_ofs_memory_address2.

xlat_ofs_memory_address2:

$$\{1\} \quad \forall (lvl: \text{Level}, \text{base}, \text{addr}: \text{Memory_Address_4G}):$$

$$\text{aligned?}(\text{bus_width} - (lvl + 1) \times \text{bits_per_level})(\text{offset}(\text{base})) \supset$$

$$0 \leq \text{offset}(\text{xlat_ofs}(lvl, \text{base}, \text{addr}))$$

Expanding the definition of xlat_ofs,
 Expanding the definition of +,
 Repeatedly Skolemizing and flattening,
 Using lemma cut_bits_below,
 we get 2 subgoals:

xlat_ofs_memory_address2.1:

<pre> {-1} cut_bits(offset(addr'), 0, -1 × lvl' × bits_per_level - bits_per_level + bus_width) < expt(2, -1 × lvl' × bits_per_level - bits_per_level + bus_width) {-2} lvl' < max_level {-3} Mem?(base' 'type_of) {-4} 0 ≤ base' 'offset {-5} base' 'offset < max_linear_offset {-6} Mem?(addr' 'type_of) {-7} 0 ≤ addr' 'offset {-8} addr' 'offset < max_linear_offset {-9} aligned?(-1 × lvl' × bits_per_level - bits_per_level + bus_width) (offset(base')) </pre>	<hr style="border: 0.5px solid black;"/> <pre> {1} 0 ≤ base' 'offset + cut_bits(offset(addr'), 0, -1 × lvl' × bits_per_level - bits_per_level + bus_width) </pre>
--	--

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of xlat_ofs_memory_address2.1.

xlat_ofs_memory_address2.2:

<pre> {-1} lvl' < max_level {-2} Mem?(base' 'type_of) {-3} 0 ≤ base' 'offset {-4} base' 'offset < max_linear_offset {-5} Mem?(addr' 'type_of) {-6} 0 ≤ addr' 'offset {-7} addr' 'offset < max_linear_offset {-8} aligned?(-1 × lvl' × bits_per_level - bits_per_level + bus_width) (offset(base')) </pre>	<hr style="border: 0.5px solid black;"/> <pre> {1} -1 × lvl' × bits_per_level - bits_per_level + bus_width ≥ 0 {2} 0 ≤ base' 'offset + cut_bits(offset(addr'), 0, -1 × lvl' × bits_per_level - bits_per_level + bus_width) </pre>
--	---

Keeping (-1 1) and hiding *,
Installing automatic rewrites from: bus_width
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of xlat_ofs_memory_address2.2.
Q.E.D.

C.114.10 Linear_Memory.raise_fault_TCC1

Terse proof for raise_fault_TCC1.

raise_fault_TCC1:

<pre> {1} ∀ (access: Memory_access, pfa: Memory_Address_4G): (Read ∈ (singleton[Memory_access](access) ∪ {Read})) </pre>	<hr style="border: 0.5px solid black;"/>
---	--

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of raise_fault_TCC1.
Q.E.D.

C.114.11 Linear_Memory.translate_TCC1

Terse proof for `translate_TCC1`.

`translate_TCC1`:

$\{1\} \quad \forall (lvl: \text{Level}, \text{base}, \text{addr}: \text{Memory_Address_4G}, \text{access}: \text{Memory_access}, \text{priv}: \text{Memory_privilege}, \text{pe_addr}: \text{Address}):$ $\text{pe_addr} = \text{xlat_idx}(lvl, \text{base}, \text{addr}) \supset$ $(\forall (\text{pe}: (\text{range_pt}(lvl))):$ $\text{accessible}?(pe, \text{access}) \wedge$ $\text{privileged}(pe, \text{priv}) \wedge \text{present}(pe) \wedge \text{paging_type}(lvl, pe)$ $\supset \text{range_pt}(lvl)(\text{set_reference}(pe, \text{access})))$
--

Repeatedly Skolemizing and flattening,

Rewriting using `set_reference_range`, matching in `*`,

This completes the proof of `translate_TCC1`.

Q.E.D.

C.114.12 Linear_Memory.translate_memory_address

Terse proof for `translate_memory_address`.

`translate_memory_address`:

$\{1\} \quad \forall (lvl: \text{Level}, \text{base}, \text{addr}: \text{Memory_Address_4G}, \text{access}: \text{Memory_access}, \text{priv}: \text{Memory_privilege},$ $s: \text{Linear_memory}):$ $\text{aligned}?(bits_per_level + pe_size)(\text{offset}(\text{base})) \wedge$ $\text{OK}?(translate(lvl, \text{base}, \text{addr}, \text{access}, \text{priv})(s))$ $\supset \text{data}(translate(lvl, \text{base}, \text{addr}, \text{access}, \text{priv})(s))^2 < \text{max_linear}$

Expanding the definition of `translate`,

Repeatedly Skolemizing and flattening,

Installing automatic rewrites from: (`##!` `<! ok_result!` `exception_result!` `fatal_result!` `raise_fault!` `max_linear!` `Mem!`)

Case splitting on `OK?(read_data(pm, paging_data_type(lvl!1)) (xlat_idx(lvl!1, base!1, addr!1))(s!1))`
`AND present?(data(read_data(pm, paging_data_type(lvl!1)) (xlat_idx(lvl!1, base!1, addr!1))(s!1)))`,

we get 2 subgoals:

translate_memory_address.1:

```

{-1} OK?(read_data(pm, paging_data_type(lvl'))(xlat_idx(lvl', base', addr'))(s')) ∧
      present?(data(read_data(pm, paging_data_type(lvl'))(xlat_idx(lvl', base', addr'))
                    (s')))
{-2} lvl' < max_level
{-3} Mem?(base' type_of)
{-4} 0 ≤ base' offset
{-5} base' offset < max_linear_offset
{-6} Mem?(addr' type_of)
{-7} 0 ≤ addr' offset
{-8} addr' offset < max_linear_offset
{-9} aligned?(bits_per_level + pe_size)(offset(base'))
{-10} OK?((read_data(pm, paging_data_type(lvl'))(xlat_idx(lvl', base', addr')) ##
          (λ (pe: (range_pt(lvl'))):
            IF paging_type?(lvl', pe)
              THEN IF present?(pe)
                THEN IF accessible?(pe, access') ∧ privileged?(pe, priv')
                  THEN write_data(pm, paging_data_type(lvl'))
                        (xlat_idx(lvl', base', addr'),
                          set_reference(pe, access'))
                  ## ok_result(is_leaf?(pe), base(pe))
                  ELSE raise_fault(priv', access', TRUE, addr')
                ENDIF
              ELSE raise_fault(priv', access', FALSE, addr')
            ENDIF
          ELSE fatal_result
          ENDIF))
      (s'))
-----
{1} data((read_data(pm, paging_data_type(lvl'))(xlat_idx(lvl', base', addr')) ##
        (λ (pe: (range_pt(lvl'))):
          IF paging_type?(lvl', pe)
            THEN IF present?(pe)
              THEN IF accessible?(pe, access') ∧ privileged?(pe, priv')
                THEN write_data(pm, paging_data_type(lvl'))
                      (xlat_idx(lvl', base', addr'),
                        set_reference(pe, access'))
                ## ok_result(is_leaf?(pe), base(pe))
              ELSE raise_fault(priv', access', TRUE, addr')
            ENDIF
          ELSE raise_fault(priv', access', FALSE, addr')
          ENDIF
        ELSE fatal_result
        ENDIF))
      (s'))'2
      < max_linear

```

Adding type constraints for base(data(read_data(pm, paging_data_type(lvl!1)) (xlat_idx(lvl!1, base!1, addr!1))(s!1))),

we get 2 subgoals:

translate_memory_address.1.1:

```

{-1} Mem?(base(data(read_data(pm, paging_data_type(lvl'))(xlat_idx(lvl', base', addr'))
                    (s')))'type_of)
{-2} 0 ≤
      base(data(read_data(pm, paging_data_type(lvl'))(xlat_idx(lvl', base', addr'))
                    (s')))'offset
{-3} base(data(read_data(pm, paging_data_type(lvl'))(xlat_idx(lvl', base', addr'))
                    (s')))'offset
      < max_linear_offset

This completes the proof of `translate_memory_address.2`.

Q.E.D.

C.114.13 Linear_Memory.translate_memory_address2

Terse proof for translate_memory_address2.

translate_memory_address2:

$\{1\} \quad \forall (lvl: \text{Level}, \text{base}, \text{addr}: \text{Memory_Address_4G}, \text{access}: \text{Memory_access}, \text{priv}: \text{Memory_privilege}, \\ s: \text{Linear_memory}): \\ \text{aligned?}(\text{bits_per_level} + \text{pe_size})(\text{offset}(\text{base})) \wedge \\ \text{OK?}(\text{translate}(lvl, \text{base}, \text{addr}, \text{access}, \text{priv})(s)) \\ \supset 0 \leq \text{offset}(\text{data}(\text{translate}(lvl, \text{base}, \text{addr}, \text{access}, \text{priv})(s)))^2$
--

Expanding the definition of translate,

Repeatedly Skolemizing and flattening,

Installing automatic rewrites from: (### <! ok_result! exception_result! fatal_result! raise_fault!
max_linear! Mem!)

Case splitting on $\text{OK?}(\text{read_data}(\text{pm}, \text{paging_data_type}(lvl!1)) (\text{xlat_idx}(lvl!1, \text{base}!1, \text{addr}!1))(s!1))$
AND $\text{present?}(\text{data}(\text{read_data}(\text{pm}, \text{paging_data_type}(lvl!1)) (\text{xlat_idx}(lvl!1, \text{base}!1, \text{addr}!1))(s!1)))$,

we get 2 subgoals:

translate_memory_address2.1:

```

{-1} OK?(read_data(pm, paging_data_type(lvl'))(xlat_idx(lvl', base', addr'))(s')) ∧
      present?(data(read_data(pm, paging_data_type(lvl'))(xlat_idx(lvl', base', addr'))
                    (s')))

      aligned?(bits_per_level + pe_size)(offset(base)) ∧
      OK?(translate(lvl, base, addr, access, priv)(s)) ∧
      data(translate(lvl, base, addr, access, priv)(s))'1
      ⊃ bus_width - bits_per_level × (lvl + 1) ≥ 0
```

Repeatedly Skolemizing and flattening,
 Keeping (-1 1) and hiding *,
 Installing automatic rewrites from: `bus_width`
 Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of `translate_result_leaf_TCC2`.
 Q.E.D.

C.114.16 Linear_Memory.translate_result_leaf

Terse proof for `translate_result_leaf`.

translate_result_leaf:

```
{1}  ∀ (lvl: Level, base, addr: Memory_Address_4G, access: Mem-
      ory_access, priv: Memory_privilege,
      s: Linear_memory):
      aligned?(bits_per_level + pe_size)(offset(base)) ∧
      OK?(translate(lvl, base, addr, access, priv)(s)) ∧
      data(translate(lvl, base, addr, access, priv)(s))'1
      ⊃
      aligned?(bus_width - bits_per_level × (lvl + 1))
        (offset(data(translate(lvl, base, addr, access, priv)(s))'2))
```

Repeatedly Skolemizing and flattening,

Expanding the definition of translate,

Installing automatic rewrites from: (##! ok_result! exception_result! fatal_result! raise_fault!
is_leaf?! bus_width! pe_size! bits_per_level! base! paging_tape?! pdir_entry?! ptab_entry?! max_level!)

Expanding the definition of paging_type?,

Expanding the definition of pdir_entry?,

Expanding the definition of ptab_entry?,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of translate_result_leaf.

Q.E.D.

C.114.17 Linear_Memory.translate_result_no_leaf_TCC1

Terse proof for translate_result_no_leaf_TCC1.

translate_result_no_leaf_TCC1:

```
{1}  ∀ (lvl: Level, base, addr: Memory_Address_4G, access: Mem-
      ory_access, priv: Memory_privilege,
      s: Linear_memory):
      aligned?(bits_per_level + pe_size)(offset(base)) ∧
      OK?(translate(lvl, base, addr, access, priv)(s)) ∧
      ¬ data(translate(lvl, base, addr, access, priv)(s))'1
      ⊃
      offset
        (data[Physical_memory, [bool, Address]]
          (translate(lvl, base, addr, access, priv)(s))'2)
      ≥ 0
```

Repeatedly Skolemizing and flattening,

Using lemma translate_memory_address2,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of translate_result_no_leaf_TCC1.

Q.E.D.

C.114.18 Linear_Memory.translate_result_no_leaf

Terse proof for translate_result_no_leaf.

`translate_result_no_leaf:`

$\{1\} \quad \forall (lvl: \text{Level}, \text{base}, \text{addr}: \text{Memory_Address_4G}, \text{access}: \text{Memory_access}, \text{priv}: \text{Memory_privilege}, \\ s: \text{Linear_memory}): \\ \text{aligned?}(\text{bits_per_level} + \text{pe_size})(\text{offset}(\text{base})) \wedge \\ \text{OK?}(\text{translate}(lvl, \text{base}, \text{addr}, \text{access}, \text{priv})(s)) \wedge \\ \neg \text{data}(\text{translate}(lvl, \text{base}, \text{addr}, \text{access}, \text{priv})(s))'1 \\ \supset \\ \text{aligned?}(\text{bits_per_level} + \text{pe_size}) \\ (\text{offset}(\text{data}(\text{translate}(lvl, \text{base}, \text{addr}, \text{access}, \text{priv})(s))'2))$

Repeatedly Skolemizing and flattening,

Expanding the definition of `translate`,

Installing automatic rewrites from: (`##!` `ok_result!` `exception_result!` `fatal_result!` `raise_fault!` `is_leaf?!` `bus_width!` `pe_size!` `bits_per_level!` `base!` `paging_tape?!` `pdir_entry?!` `ptab_entry?!` `max_level!`)

Expanding the definition of `paging_type?`,

Expanding the definition of `pdir_entry?`,

Expanding the definition of `ptab_entry?`,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `translate_result_no_leaf`.

Q.E.D.

C.114.19 Linear_Memory.linear_resolve_TCC1

Terse proof for `linear_resolve_TCC1`.

`linear_resolve_TCC1:`

$\{1\} \quad \forall (\text{addr}: \text{Memory_Address_4G}, \text{cs}: \text{Segment_Reg_type}, \text{priv}: \text{Memory_privilege}): \\ \text{priv} = \text{segment_to_priv}(\text{cs}) \supset \\ (\forall (\text{pdbr}: \text{Pdbr_type}, \text{lvl}: \text{nat}): \text{lvl} = \text{pdir_lvl} \supset \text{lvl} < \text{max_level})$
--

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `linear_resolve_TCC1`.

Q.E.D.

C.114.20 Linear_Memory.linear_resolve_TCC2

Terse proof for `linear_resolve_TCC2`.

linear_resolve_TCC2:

```
{1}  ∀ (addr: Memory_Address_4G, access: Memory_access, cs: Segment_Reg_type,
      priv: Memory_privilege):
      priv = segment_to_priv(cs) ⊃
      (∀ (pdir: Pdir_type, lvl: nat):
        lvl = pdir.lvl ⊃
        (∀ (x1: Physical_memory):
          every[Physical_memory, [bool, Address]]
            (λ (x: Physical_memory): TRUE,
              λ (t: [bool, Address]):
                Mem?(t'2'type_of) ∧
                (0 ≤ t'2'offset ∧ t'2'offset < max_linear_offset) ∧
                IF t'1
                  THEN aligned?(-1 × lvl × bits_per_level - bits_per_level + bus_width)
                        (offset(t'2))
                  ELSE aligned?(bits_per_level + pe_size)(offset(t'2))
                ENDIF)
            (translate(lvl, pdir'base_addr, addr, access, priv)(x1))))
```

Repeatedly Skolemizing and flattening,
 Expanding the definition of every,
 Using lemma translate_result_leaf,
 Using lemma translate_result_no_leaf,
 Using lemma translate_memory_address,
 Using lemma translate_memory_address2,
 Installing automatic rewrites from: max_linear Mem < bits_per_level pe_size
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 This completes the proof of linear_resolve_TCC2.
 Q.E.D.

C.114.21 Linear_Memory.linear_resolve_TCC3

Terse proof for linear_resolve_TCC3.

linear_resolve_TCC3:

```
{1}  ∀ (addr: Memory_Address_4G, cs: Segment_Reg_type, priv: Memory_privilege):
      priv = segment_to_priv(cs) ⊃
      (∀ (pdir: Pdir_type, lvl: nat):
        lvl = pdir.lvl ⊃ (∀ (leaf: bool, b: Memory_Address_4G): leaf ⊃ off-
          set(b) ≥ 0))
```

Repeatedly Skolemizing and flattening,
 Installing automatic rewrites from: bus_width bits_per_level max_level
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 This completes the proof of linear_resolve_TCC3.
 Q.E.D.

C.114.22 Linear_Memory.linear_resolve_TCC4

Terse proof for linear_resolve_TCC4.

linear_resolve_TCC4:

```
{1}  ∀ (addr: Memory_Address_4G, cs: Segment_Reg_type, priv: Memory_privilege):
      priv = segment_to_priv(cs) ⊃
        (∀ (pdir: Pdir_type, lvl: nat):
          lvl = pdir_lvl ⊃
            (∀ (leaf: bool, b: Memory_Address_4G):
              leaf ⊃ bus_width - bits_per_level × (lvl + 1) ≥ 0))
```

Repeatedly Skolemizing and flattening,
 Installing automatic rewrites from: bus_width bits_per_level max_level pdir_lvl
 Simplifying, rewriting, and recording with decision procedures,
 This completes the proof of linear_resolve_TCC4.
 Q.E.D.

C.114.23 Linear_Memory.linear_resolve_TCC5

Terse proof for linear_resolve_TCC5.

linear_resolve_TCC5:

```
{1}  ∀ (addr: Memory_Address_4G, cs: Segment_Reg_type, priv: Memory_privilege):
      priv = segment_to_priv(cs) ⊃
        (∀ (pdir: Pdir_type, lvl: nat):
          lvl = pdir_lvl ⊃
            (∀ (leaf: bool, b: Memory_Address_4G): ¬ leaf ⊃ offset(b) ≥ 0))
```

Repeatedly Skolemizing and flattening,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 This completes the proof of linear_resolve_TCC5.
 Q.E.D.

C.114.24 Linear_Memory.linear_resolve_TCC6

Terse proof for linear_resolve_TCC6.

linear_resolve_TCC6:

```
{1}  ∀ (addr: Memory_Address_4G, cs: Segment_Reg_type, priv: Memory_privilege):
      priv = segment_to_priv(cs) ⊃
        (∀ (pdir: Pdir_type, lvl: nat):
          lvl = pdir_lvl ⊃
            (∀ (leaf: bool,
              base:
                {b: Memory_Address_4G |
                  IF leaf
                    THEN aligned?(bus_width - bits_per_level × (lvl + 1))
                          (offset(b))
                  ELSE aligned?(bits_per_level + pe_size)(offset(b))
                  ENDIF}):
              ¬ leaf ⊃ (∀ (lvl1: nat): lvl1 = ptab_lvl ⊃ lvl1 < max_level))))
```

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of linear_resolve_TCC6.

Q.E.D.

C.114.25 Linear_Memory.linear_resolve_TCC7

Terse proof for linear_resolve_TCC7.

linear_resolve_TCC7:

```

{1}  ∀ (addr: Memory_Address_4G, access: Memory_access, cs: Segment_Reg_type,
      priv: Memory_privilege):
  priv = segment_to_priv(cs) ⊃
  (∀ (pdir: Pdir_type, lvl: nat):
    lvl = pdir_lvl ⊃
    (∀ (leaf: bool,
        base:
          {b: Memory_Address_4G |

              λ (t: [bool, Address]):
                Mem?(t'2'type_of) ∧
                0 ≤ t'2'offset ∧ t'2'offset < max_linear_offset)
            (translate(lvl1, base, addr, access, priv)(x1))))))

```

Repeatedly Skolemizing and flattening,

Expanding the definition of every,

Using lemma translate_memory_address,

Using lemma translate_memory_address2,

Installing automatic rewrites from: max_linear Mem < bits_per_level pe_size

Using lemma translate_result_leaf,

Using lemma translate_result_no_leaf,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of linear_resolve_TCC7.

Q.E.D.

C.114.26 Linear_Memory.linear_resolve_TCC8

Terse proof for linear_resolve_TCC8.

`linear_resolve_TCC8:`

<pre>{1} ∀ (leaf: bool, addr: Memory_Address_4G, cs: Segment_Reg_type, priv: Mem- ory_privilege): priv = segment_to_priv(cs) ⊃ (∀ (pdir: Pdir_type, lvl: nat): lvl = pdir_lvl ⊃ (∀ (b: Memory_Address_4G): leaf ⊃ -1 × lvl × bits_per_level - bits_per_level + bus_width ≥ 0))</pre>

Repeatedly Skolemizing and flattening,

Keeping (-9 1) and hiding *,

Installing automatic rewrites from: bus_width

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `linear_resolve_TCC8`.

Q.E.D.

C.114.27 Linear_Memory.linear_resolve_memory_address

Terse proof for `linear_resolve_memory_address`.

`linear_resolve_memory_address:`

<pre>{1} ∀ (access: Memory_access, addr: Memory_Address_4G, x1: Linear_memory): every [Linear_memory, Address] (λ (x: Linear_memory): TRUE, λ (x: Address): Mem?(x'type_of) ∧ 0 ≤ x'offset ∧ x'offset < max_linear_offset) (linear_resolve(addr, access)(x1))</pre>

Repeatedly Skolemizing and flattening,

Expanding the definition of every,

Expanding the definition of linear_resolve,

Expanding the definition of ##,

Expanding the definition of ok_result,

Installing automatic rewrites from: max_linear Mem < bits_per_level bus_width min_linear
 Address_Helpers.<= max_level pe_size xlat_ofs_memory_address! pdir_lvl ptab_lvl trans-
 late_result_leaf translate_result_no_leaf translate_memory_address! translate_memory_address!
 xlat_ofs_memory_address2! translate_result_leaf translate_result_no_leaf

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 6 subgoals:

linear_resolve_memory_address.1:

{-1}	Mem?(addr' 'type_of)
{-2}	$0 \leq \text{addr}' \text{'offset}$
{-3}	$\text{addr}' \text{'offset} < \text{max_linear_offset}$
{-4}	OK?(read_data(pm, segment_reg_data_type)(CS)(x ₁ '))
{-5}	OK?(read_data(pm, pdb_r_data_type)(PDBR) (state(read_data(pm, segment_reg_data_type)(CS)(x ₁ '))))
{-6}	OK?(translate(0, data(read_data(pm, pdb_r_data_type)(PDBR) (state(read_data(pm, segment_reg_data_type)(CS) (x ₁ ')))) 'base_addr, addr', access', segment_to_priv(data(read_data(pm, seg- ment_reg_data_type)(CS)(x ₁ ')))) (state(read_data(pm, pdb_r_data_type)(PDBR) (state(read_data(pm, segment_reg_data_type)(CS) (x ₁ '))))))))
{-7}	data(translate(0, data(read_data(pm, pdb_r_data_type)(PDBR) (state(read_data(pm, segment_reg_data_type)(CS) (x ₁ ')))) 'base_addr, addr', access', segment_to_priv(data(read_data(pm, seg- ment_reg_data_type)(CS)(x ₁ ')))) (state(read_data(pm, pdb_r_data_type)(PDBR) (state(read_data(pm, segment_reg_data_type)(CS) (x ₁ ')))))))) '1

```

Using lemma `xlat_ofs_memory_address2`,

Using lemma `translate_result_no_leaf`,

Using lemma `translate_result_no_leaf`,

Using lemma `translate_result_leaf`,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `linear_resolve_memory_address.5`.

Using lemma translate_result_no_leaf,
 Using lemma translate_result_leaf,
 Using lemma translate_result_no_leaf,
 Using lemma translate_memory_address,
 Using lemma xlat_ofs_memory_address,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 This completes the proof of `linear_resolve_memory_address.6`.
 Q.E.D.

C.114.28 Linear_Memory.linear_read_TCC1

Terse proof for `linear_read_TCC1`.

`linear_read_TCC1`:

`{1}` Mem?(min_linear 'type_of)

Expanding the definition of `min_linear`,
 Rewriting using `Mem`, matching in `*`,
 Simplifying, rewriting, and recording with decision procedures,
 This completes the proof of `linear_read_TCC1`.
 Q.E.D.

C.114.29 Linear_Memory.linear_read_TCC2

Terse proof for `linear_read_TCC2`.

`linear_read_TCC2`:

`{1}` Mem?(max_linear 'type_of)

Expanding the definition of `max_linear`,
 Expanding the definition of `Mem`,
 which is trivially true.
 This completes the proof of `linear_read_TCC2`.
 Q.E.D.

C.114.30 Linear_Memory.linear_read_TCC3

Terse proof for `linear_read_TCC3`.

`linear_read_TCC3`:

`{1}` $\forall (a: \text{Address}):$
 $\text{Mem}?(\text{type_of}(a)) \wedge \text{in_memory}(\text{min_linear}, \text{max_linear})(a) \supset$
 $0 \leq a' \text{offset} \wedge a' \text{offset} < \text{max_linear_offset}$

Expanding the definition of `min_linear`,
 Trying repeated skolemization, instantiation, and if-lifting,
 Expanding the definition of `max_linear`,
 Expanding the definition of `max_linear_offset`,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 This completes the proof of `linear_read_TCC3`.
 Q.E.D.

C.114.31 Linear_Memory.linear_read_side_effect_TCC1

Terse proof for `linear_read_side_effect_TCC1`.

`linear_read_side_effect_TCC1`:

<pre> {1} ∃ (a: Address, bl: list[Byte], s: Linear_memory): Mem?(type_of(a)) ∧ (null?(bl) ∨ (reg_base(min_linear)(type_of(a)) ≤ a ∧ a + length(bl) ≤ reg_size(max_linear)(type_of(a)))) ⊃ every[[Address, list[Byte]]] (λ (t: [Address, list[Byte]]): Mem?(t'1'type_of) ∧ 0 ≤ t'1'offset ∧ t'1'offset < max_linear_offset) (split(min_page, a, bl)) </pre>

Repeatedly Skolemizing and flattening,

Hiding formulas: -1,

Case splitting on `bl' = null`,

we get 2 subgoals:

`linear_read_side_effect_TCC1.1`:

<pre> {-1} bl' = null {-2} Mem?(type_of(a')) {-3} null?(bl') ∨ (reg_base(min_linear)(type_of(a')) ≤ a' ∧ a' + length(bl') ≤ reg_size(max_linear)(type_of(a'))) </pre>
<pre> {1} every[[Address, list[Byte]]] (λ (t: [Address, list[Byte]]): Mem?(t'1'type_of) ∧ 0 ≤ t'1'offset ∧ t'1'offset < max_linear_offset) (split(min_page, a', bl')) </pre>

Using lemma `split_null`,

Expanding the definition of `every`,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `linear_read_side_effect_TCC1.1`.

`linear_read_side_effect_TCC1.2`:

<pre> {-1} Mem?(type_of(a')) {-2} null?(bl') ∨ (reg_base(min_linear)(type_of(a')) ≤ a' ∧ a' + length(bl') ≤ reg_size(max_linear)(type_of(a'))) </pre>
<pre> {1} bl' = null {2} every[[Address, list[Byte]]] (λ (t: [Address, list[Byte]]): Mem?(t'1'type_of) ∧ 0 ≤ t'1'offset ∧ t'1'offset < max_linear_offset) (split(min_page, a', bl')) </pre>

Using lemma `split_range`,

Using lemma `split_no_null`,

Using lemma `every_implied`,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 2 subgoals:

linear_read_side_effect_TCC1.2.1:

{-1}	cons?(bl')
{-2}	every($\lambda (a_2: \text{Address}, \text{bl2}: \text{list}[\text{Byte}]): \text{cons?}(\text{bl2})(\text{split}(\text{min_page}, a', \text{bl}'))$)
{-3}	every($\lambda (a_2: \text{Address}, \text{bl2}: \text{list}[\text{Byte}]):$ $a' \leq a_2 \wedge a_2 + \text{length}(\text{bl2}) \leq a' + \text{length}(\text{bl}')$ $(\text{split}(\text{min_page}, a', \text{bl}'))$)
{-4}	Mem?(type_of(a'))
{-5}	reg_base(min_linear)(type_of(a')) $\leq a'$
{-6}	$a' + \text{length}(\text{bl}') \leq \text{reg_size}(\text{max_linear})(\text{type_of}(a'))$
{1}	every($(\lambda (a_2: \text{Address}, \text{bl2}: \text{list}[\text{Byte}]):$ $\text{cons?}(\text{bl2}) \wedge a' \leq a_2 \wedge a_2 + \text{length}(\text{bl2}) \leq a' + \text{length}(\text{bl}')$ $(\text{split}(\text{min_page}, a', \text{bl}'))$)
{2}	every([[Address, list[Byte]]] $(\lambda (t: [\text{Address}, \text{list}[\text{Byte}]]):$ $\text{Mem?}(t'1'\text{type_of}) \wedge 0 \leq t'1'\text{offset} \wedge t'1'\text{offset} < \text{max_linear_offset}$ $(\text{split}(\text{min_page}, a', \text{bl}'))$)

Hiding formulas: 2,

Using lemma every_conjunct_left,

Simplifying, rewriting, and recording with decision procedures,

This completes the proof of linear_read_side_effect_TCC1.2.1.

linear_read_side_effect_TCC1.2.2:

{-1}	cons?(bl')
{-2}	every($\lambda (a_2: \text{Address}, \text{bl2}: \text{list}[\text{Byte}]): \text{cons?}(\text{bl2})(\text{split}(\text{min_page}, a', \text{bl}'))$)
{-3}	every($\lambda (a_2: \text{Address}, \text{bl2}: \text{list}[\text{Byte}]):$ $a' \leq a_2 \wedge a_2 + \text{length}(\text{bl2}) \leq a' + \text{length}(\text{bl}')$ $(\text{split}(\text{min_page}, a', \text{bl}'))$)
{-4}	Mem?(type_of(a'))
{-5}	reg_base(min_linear)(type_of(a')) $\leq a'$
{-6}	$a' + \text{length}(\text{bl}') \leq \text{reg_size}(\text{max_linear})(\text{type_of}(a'))$
{1}	$\forall (t_1: [\text{Address}, \text{list}[\text{Byte}]]):$ $\text{cons?}(t_1'2) \wedge a' \leq t_1'1 \wedge t_1'1 + \text{length}(t_1'2) \leq a' + \text{length}(\text{bl}')$ $\supset \text{Mem?}(t_1'1'\text{type_of}) \wedge 0 \leq t_1'1'\text{offset} \wedge t_1'1'\text{offset} < \text{max_linear_offset}$
{2}	every([[Address, list[Byte]]] $(\lambda (t: [\text{Address}, \text{list}[\text{Byte}]]):$ $\text{Mem?}(t'1'\text{type_of}) \wedge 0 \leq t'1'\text{offset} \wedge t'1'\text{offset} < \text{max_linear_offset}$ $(\text{split}(\text{min_page}, a', \text{bl}'))$)

Hiding formulas: (-2 -3 2),

Trying repeated skolemization, instantiation, and if-lifting,

Expanding the definition of max_linear,

Expanding the definition of Mem,

Expanding the definition of max_linear_offset,

Simplifying, rewriting, and recording with decision procedures,

This completes the proof of linear_read_side_effect_TCC1.2.2.

Q.E.D.

C.115 Proofs for Linear_Memory_Blessing (challenge-linear.pvs)

C.115.1 Linear_Memory_Blessing.PTab_Address_TCC1

Terse proof for PTab_Address_TCC1.

PTab_Address_TCC1:

$$\{1\} \quad \forall (a: \text{Memory_Address_4G}): \text{offset}(a) \geq 0$$

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of PTab_Address_TCC1.

Q.E.D.

C.115.2 Linear_Memory_Blessing.pe_in_pdir_range?_TCC1

Terse proof for pe_in_pdir_range?_TCC1.

pe_in_pdir_range?_TCC1:

$$\{1\} \quad \forall (s: \text{Linear_memory}[\text{Physical_memory}, \text{pm_phy}], \text{linear_range}: \text{PRED}[\text{Memory_Address_4G}], \\ \text{phy_a}: \text{Memory_Address_4G}, \text{res}: \text{ExprResult}[\text{Physical_memory}, \text{Pdbr_type}]): \\ \text{OK?}(\text{res}) \wedge \text{res} = \text{read_data}(\text{pm_phy}, \text{pdbr_data_type})(\text{PDBR})(s) \supset \\ (\forall (\text{lin_a}: (\text{linear_range})): \text{pdir_lvl}[\text{Physical_memory}, \text{pm_phy}] < \text{max_level})$$

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of pe_in_pdir_range?_TCC1.

Q.E.D.

C.115.3 Linear_Memory_Blessing.pe_in_ptab_range?_TCC1

Terse proof for pe_in_ptab_range?_TCC1.

{1}	$\exists (\text{pe}: \text{Memory_Address_4G}, lvl: \text{Level}):$ $\text{pe_in_pt_range?}(s', \text{linear_range}', lvl)(\text{pe}) \wedge$ $\text{address_block}(\text{pe}, \text{expt}(2, \text{pe_size}))(x')$

Instantiating quantified variables,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 This completes the proof of pe_in_pt_address_in_pt.1.

pe_in_pt_address_in_pt.2:

{-1}	$lvl' < \text{max_level}$
{-2}	$\text{Mem?}(\text{base}' \text{ type_of})$
{-3}	$0 \leq \text{base}' \text{ offset}$
{-4}	$\text{base}' \text{ offset} < \text{max_linear_offset}$
{-5}	$\text{pe_in_pt_range?}(s', \text{linear_range}', lvl')(\text{base}')$
{-6}	$\text{address_block}(\text{base}', \text{expt}(2, \text{pe_size}))(x')$
{1}	$x' \text{ offset} < \text{max_linear_offset}$

Using lemma pe_in_pt_range_aligned,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 Expanding the definition of address_block,
 Applying disjunctive simplification to flatten sequent,
 Using lemma aligned_add_below,
 we get 2 subgoals:

pe_in_pt_address_in_pt.2.1:

{-1}	$\text{pe_size} \leq \text{bus_width} \wedge$ $\text{offset}(\text{base}') < \text{expt}(2, \text{bus_width}) \wedge$ $\text{aligned?}(\text{pe_size})(\text{offset}(\text{base}')) \wedge \text{expt}(2, \text{pe_size}) - 1 < \text{expt}(2, \text{pe_size})$ $\supset \text{offset}(\text{base}') + \text{expt}(2, \text{pe_size}) - 1 < \text{expt}(2, \text{bus_width})$
{-2}	$\text{pe_in_pt_range?}(s', \text{linear_range}', lvl')(\text{base}')$
{-3}	$\text{aligned?}(\text{pe_size})(\text{offset}(\text{base}'))$
{-4}	$lvl' < \text{max_level}$
{-5}	$\text{Mem?}(\text{base}' \text{ type_of})$
{-6}	$0 \leq \text{base}' \text{ offset}$
{-7}	$\text{base}' \text{ offset} < \text{max_linear_offset}$
{-8}	$\text{type_of}(\text{base}') = \text{type_of}(x')$
{-9}	$\text{offset}(x') < \text{offset}(\text{base}') + \text{expt}(2, \text{pe_size})$
{1}	$x' \text{ offset} < \text{max_linear_offset}$

Installing automatic rewrites from: (max_linear_offset! bus_width! pe_size!)
 Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `pe_in_pt_address_in_pt.2.1`.

`pe_in_pt_address_in_pt.2.2`:

{-1}	<code>pe_in_pt_range?(s', linear_range', lvl')(base')</code>
{-2}	<code>aligned?(pe_size)(offset(base'))</code>
{-3}	<code>lvl' < max_level</code>
{-4}	<code>Mem?(base' type_of)</code>
{-5}	<code>0 ≤ base' offset</code>
{-6}	<code>base' offset < max_linear_offset</code>
{-7}	<code>type_of(base') = type_of(x')</code>
{-8}	<code>offset(x') < offset(base') + expt(2, pe_size)</code>
{1}	<code>expt(2, pe_size) - 1 ≥ 0</code>
{2}	<code>x' offset < max_linear_offset</code>

Keeping (1) and hiding *,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `pe_in_pt_address_in_pt.2.2`.

`pe_in_pt_address_in_pt.3`:

{-1}	<code>lvl' < max_level</code>
{-2}	<code>Mem?(base' type_of)</code>
{-3}	<code>0 ≤ base' offset</code>
{-4}	<code>base' offset < max_linear_offset</code>
{-5}	<code>pe_in_pt_range?(s', linear_range', lvl')(base')</code>
{-6}	<code>address_block(base', expt(2, pe_size))(x')</code>
{1}	<code>0 ≤ x' offset</code>

Expanding the definition of `address_block`,
which is trivially true.

This completes the proof of `pe_in_pt_address_in_pt.3`.

`pe_in_pt_address_in_pt.4`:

{-1}	<code>lvl' < max_level</code>
{-2}	<code>Mem?(base' type_of)</code>
{-3}	<code>0 ≤ base' offset</code>
{-4}	<code>base' offset < max_linear_offset</code>
{-5}	<code>pe_in_pt_range?(s', linear_range', lvl')(base')</code>
{-6}	<code>address_block(base', expt(2, pe_size))(x')</code>
{1}	<code>Mem?(x' type_of)</code>

Expanding the definition of `address_block`,
which is trivially true.

This completes the proof of `pe_in_pt_address_in_pt.4`.

C.116 Proofs for Linear_Memory_Blessing_Properties (challenge-linear.pvs)

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Expanding the definition of `virt_to_phys_range`,

Instantiating quantified variables,

Expanding the definition of `singleton`,

Expanding the definition of `restrict`,

which is trivially true.

This completes the proof of `linear_plain_changed_memory_invariant.1.1.1.1.1.1.2.1`.

linear_plain_changed_memory_invariant.1.1.1.1.1.1.2.2:

    = bl'

```

Simplifying, rewriting, and recording with decision procedures,

Using lemma pm_plain_phy,

Using lemma pm_states,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Using lemma plain_memory_side_effect_content_unchanged_write_block,

Expanding the definition of side_effect_content_unchanged,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 2 subgoals:

linear_plain_write_side_effect_unchanged.2.1.1:

{-1}	$\forall (s: \text{Physical_memory}, a: \text{Address}, \text{bl}: \text{list}[\text{Byte}], \text{cp}: \text{bool}):$ $\text{pm_phy}'\text{states}(s) \wedge$ $(\text{address_block}(a, \text{length}(\text{bl})) \subseteq \text{address_block}(a', \text{length}(\text{bl}')) \wedge$ $\text{OK}?(\text{memory_write_side_effect}(\text{pm_phy}'\text{mem})(a, \text{bl}, \text{cp})(s))$ $\supset \text{data}(\text{memory_write_side_effect}(\text{pm_phy}'\text{mem})(a, \text{bl}, \text{cp})(s)) = \text{bl}$
{-2}	$\text{is_linear_plain_memory}?(\text{pm}')$
{-3}	$\text{pm}'\text{states} = \text{pm_phy}'\text{states}$
{-4}	$\text{plain_memory}?(\text{pm_phy})$
{-5}	$\text{null}?(\text{bl}')$
{-6}	$\text{pm}'\text{states}(s')$
{-7}	$(\text{address_block}(a', \text{length}(\text{bl}')) \subseteq \text{pm}'\text{rw_addr})$
{-8}	$\text{OK}?(\text{memory_write_side_effect}(\text{pm_phy}'\text{mem})(a', \text{bl}', \text{cp}')(s'))$
{1}	$\text{union}(\text{pm}'\text{ro_addr}, \text{pm}'\text{rw_addr})(a')$
{2}	$\text{Mem}?(\text{type_of}(a'))$
{3}	$\text{data}(\text{memory_write_side_effect}(\text{pm_phy}'\text{mem})(a', \text{bl}', \text{cp}')(s')) = \text{bl}'$

Instantiating quantified variables,

Rewriting using subset_reflexive, matching in *,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of linear_plain_write_side_effect_unchanged.2.1.1.

linear_plain_write_side_effect_unchanged.2.1.2:

{-1}	$\text{is_linear_plain_memory}?(\text{pm}')$
{-2}	$\text{pm}'\text{states} = \text{pm_phy}'\text{states}$
{-3}	$\text{plain_memory}?(\text{pm_phy})$
{-4}	$\text{null}?(\text{bl}')$
{-5}	$\text{pm}'\text{states}(s')$
{-6}	$(\text{address_block}(a', \text{length}(\text{bl}')) \subseteq \text{pm}'\text{rw_addr})$
{-7}	$\text{OK}?(\text{memory_write_side_effect}(\text{pm_phy}'\text{mem})(a', \text{bl}', \text{cp}')(s'))$

 Keeping (-3 1 2) and hiding *,
 Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of linear_plain_write_side_effect_unchanged.2.2.
 Q.E.D.

C.116.9

Linear_Memory_Blessing_Properties.linear_memory_plain_memory

Terse proof for linear_memory_plain_memory.

linear_memory_plain_memory:

{1}	\forall (pm: Plain_Memory[Physical_memory]): is_linear_plain_memory?(pm) \supset plain_memory?(pm)
-----	--

Expanding the definition of plain_memory?,

Repeatedly Skolemizing and flattening,

Installing automatic rewrites from: (linear_plain_transformers_ok! linear_plain_unchanged_memory_invariant!
 linear_plain_unchanged_memory_invariant_write! linear_plain_unchanged_memory_write_invariant! lin-
 ear_plain_changed_memory_invariant! linear_plain_read_side_effect_unchanged! linear_plain_write_side_effect_uncha

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `linear_memory_plain_memory`.
Q.E.D.

C.117 Proofs for Linear_Memory_Properties (challenge-linear.pvs)

C.117.1 Linear_Memory_Properties.pm_read_linear

Terse proof for `pm_read_linear`.

`pm_read_linear`:

$$\frac{\{1\} \quad \forall (\text{pm}: \text{Plain_Memory}[\text{Linear_memory}], a: \text{Address}):}{\text{is_linear_plain_memory?}(\text{pm}) \supset \text{memory_read}(\text{pm}'\text{mem})(a) = \text{linear_read}(a)}$$

Repeatedly Skolemizing and flattening,
Expanding the definition of `is_linear_plain_memory?`,
Applying disjunctive simplification to flatten sequent,
Expanding the definition of `linear_pm`,
Replacing using formula -1,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `pm_read_linear`.
Q.E.D.

C.117.2 Linear_Memory_Properties.pm_write_linear

Terse proof for `pm_write_linear`.

`pm_write_linear`:

$$\frac{\{1\} \quad \forall (\text{pm}: \text{Plain_Memory}[\text{Linear_memory}], a: \text{Address}, b: \text{Byte}):}{\text{is_linear_plain_memory?}(\text{pm}) \supset \text{memory_write}(\text{pm}'\text{mem})(a, b) = \text{linear_write}(a, b)}$$

Repeatedly Skolemizing and flattening,
Expanding the definition of `is_linear_plain_memory?`,
Applying disjunctive simplification to flatten sequent,
Replacing using formula -2,
Expanding the definition of `linear_pm`,
which is trivially true.
This completes the proof of `pm_write_linear`.
Q.E.D.

C.117.3 Linear_Memory_Properties.pm_read_side_effect_linear

Terse proof for `pm_read_side_effect_linear`.

`pm_read_side_effect_linear`:

$$\frac{\{1\} \quad \forall (\text{pm}: \text{Plain_Memory}[\text{Linear_memory}], a: \text{Address}, \text{bl}: \text{list}[\text{Byte}], \text{cp}: \text{bool}):}{\text{is_linear_plain_memory?}(\text{pm}) \supset \text{memory_read_side_effect}(\text{pm}'\text{mem})(a, \text{bl}, \text{cp}) = \text{linear_read_side_effect}(a, \text{bl}, \text{cp})}$$

Repeatedly Skolemizing and flattening,

C Proof scripts

Expanding the definition of `is_linear_plain_memory?`,
Applying disjunctive simplification to flatten sequent,
Replacing using formula -2,
Expanding the definition of `linear_pm`,
which is trivially true.
This completes the proof of `pm_read_side_effect_linear`.
Q.E.D.

C.117.4 Linear_Memory_Properties.pm_write_side_effect_linear

Terse proof for `pm_write_side_effect_linear`.

`pm_write_side_effect_linear`:

$$\{1\} \quad \forall (pm: \text{Plain_Memory}[\text{Linear_memory}], a: \text{Address}, bl: \text{list}[\text{Byte}], cp: \text{bool}):$$

$$\text{is_linear_plain_memory?}(pm) \supset$$
$$\text{memory_write_side_effect}(pm\text{'mem})(a, bl, cp) = \text{linear_write_side_effect}(a, bl, cp)$$

Repeatedly Skolemizing and flattening,
Expanding the definition of `is_linear_plain_memory?`,
Expanding the definition of `linear_pm`,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `pm_write_side_effect_linear`.
Q.E.D.

C.117.5 Linear_Memory_Properties.pm_states

Terse proof for `pm_states`.

`pm_states`:

$$\{1\} \quad \forall (pm: \text{Plain_Memory}[\text{Linear_memory}]):$$

$$\text{is_linear_plain_memory?}(pm) \supset pm\text{'states} = pm\text{'phy}\text{'states}$$

Expanding the definition of `is_linear_plain_memory?`,
Repeatedly Skolemizing and flattening,
This completes the proof of `pm_states`.
Q.E.D.

C.117.6 Linear_Memory_Properties.pm_plain_phy

Terse proof for `pm_plain_phy`.

`pm_plain_phy`:

$$\{1\} \quad \forall (pm: \text{Plain_Memory}[\text{Linear_memory}]): \text{is_linear_plain_memory?}(pm) \supset \text{plain_memory?}(pm\text{'phy})$$

Repeatedly Skolemizing and flattening,
Expanding the definition of `is_linear_plain_memory?`,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `pm_plain_phy`.
Q.E.D.

C.117.7 Linear_Memory_Properties.pm_memory_addr_TCC1

Terse proof for pm_memory_addr_TCC1.

pm_memory_addr_TCC1:

{1}	$\forall (pm: \text{Plain_Memory}[\text{Linear_memory}], a: \text{Address}):$ $\text{is_linear_plain_memory?}(pm) \wedge \text{union}(pm\text{'ro_addr}, pm\text{'rw_addr})(a) \supset$ $\text{Mem?}(\text{min_linear}'\text{type_of})$
-----	--

Repeatedly Skolemizing and flattening,
 Expanding the definition of min_linear,
 Expanding the definition of Mem,
 which is trivially true.

This completes the proof of pm_memory_addr_TCC1.

Q.E.D.

C.117.8 Linear_Memory_Properties.pm_memory_addr_TCC2

Terse proof for pm_memory_addr_TCC2.

pm_memory_addr_TCC2:

{1}	$\forall (pm: \text{Plain_Memory}[\text{Linear_memory}], a: \text{Address}):$ $\text{is_linear_plain_memory?}(pm) \wedge \text{union}(pm\text{'ro_addr}, pm\text{'rw_addr})(a) \supset$ $\text{Mem?}(\text{max_linear}'\text{type_of})$
-----	--

Repeatedly Skolemizing and flattening,
 Expanding the definition of max_linear,
 Expanding the definition of Mem,
 which is trivially true.

This completes the proof of pm_memory_addr_TCC2.

Q.E.D.

C.117.9 Linear_Memory_Properties.pm_memory_addr

Terse proof for pm_memory_addr.

pm_memory_addr:

{1}	$\forall (pm: \text{Plain_Memory}[\text{Linear_memory}], a: \text{Address}):$ $\text{is_linear_plain_memory?}(pm) \wedge \text{union}(pm\text{'ro_addr}, pm\text{'rw_addr})(a) \supset$ $\text{in_memory}(\text{min_linear}, \text{max_linear})(a) \wedge \text{Mem?}(\text{type_of}(a))$
-----	--

Expanding the definition of is_linear_plain_memory?,
 Repeatedly Skolemizing and flattening,
 Expanding the definition of max_linear,
 Expanding the definition of Mem,
 Instantiating quantified variables,
 Keeping (-13 1) and hiding *,
 Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of pm_memory_addr.

Q.E.D.

C.117.10 Linear_Memory_Properties.pm_linear_blessed

Terse proof for pm_linear_blessed.

pm_linear_blessed:

$$\{1\} \quad \forall (pm: \text{Plain_Memory}[\text{Linear_memory}], s: \text{Linear_memory}[\text{Physical_memory}, pm_phy]):$$

$$\text{is_linear_plain_memory?}(pm) \wedge pm' \text{states}(s) \supset$$

$$\text{linear_blessed?}(s, \text{restrict}[\text{Address}, \text{Memory_Address_4G}, \text{boolean}](pm' \text{ro_addr}),$$

$$\text{restrict}[\text{Address}, \text{Memory_Address_4G}, \text{boolean}](pm' \text{rw_addr}))$$

Expanding the definition of is_linear_plain_memory?,
 Repeatedly Skolemizing and flattening,
 Instantiating quantified variables,
 This completes the proof of pm_linear_blessed.
 Q.E.D.

C.117.11

Linear_Memory_Properties.pm_linear_resolve_read_ok_TCC1

Terse proof for pm_linear_resolve_read_ok_TCC1.

pm_linear_resolve_read_ok_TCC1:

$$\{1\} \quad \forall (pm: \text{Plain_Memory}[\text{Linear_memory}], s: (pm' \text{states}),$$

$$a: ((pm' \text{ro_addr} \cup pm' \text{rw_addr})):$$

$$\text{is_linear_plain_memory?}(pm) \supset$$

$$\text{Mem?}(a' \text{type_of}) \wedge 0 \leq a' \text{offset} \wedge a' \text{offset} < \text{max_linear_offset}$$

Repeatedly Skolemizing and flattening,
 Expanding the definition of is_linear_plain_memory?,
 Applying disjunctive simplification to flatten sequent,
 Instantiating quantified variables,
 This completes the proof of pm_linear_resolve_read_ok_TCC1.
 Q.E.D.

C.117.12 Linear_Memory_Properties.pm_linear_resolve_read_ok

Terse proof for pm_linear_resolve_read_ok.

pm_linear_resolve_read_ok:

$$\{1\} \quad \forall (pm: \text{Plain_Memory}[\text{Linear_memory}], s: (pm' \text{states}),$$

$$a: ((pm' \text{ro_addr} \cup pm' \text{rw_addr})):$$

$$\text{is_linear_plain_memory?}(pm) \supset \text{OK?}(\text{linear_resolve}(a, \text{Read})(s))$$

Repeatedly Skolemizing and flattening,
 Using lemma pm_linear_blessed,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 Expanding the definition of linear_blessed?,
 Applying disjunctive simplification to flatten sequent,
 Instantiating quantified variables,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 Keeping (-9 1) and hiding *,
 Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of pm_linear_resolve_read_ok.
Q.E.D.

C.117.13

Linear_Memory_Properties.pm_linear_resolve_write_ok_TCC1

Terse proof for pm_linear_resolve_write_ok_TCC1.

pm_linear_resolve_write_ok_TCC1:

$$\{1\} \quad \forall (pm: Plain_Memory[Linear_memory], s: (pm'states), a: (pm'rw_addr)):$$

$$\text{is_linear_plain_memory?}(pm) \supset$$

$$\text{Mem?}(a'\text{type_of}) \wedge 0 \leq a'\text{offset} \wedge a'\text{offset} < \text{max_linear_offset}$$

Expanding the definition of is_linear_plain_memory?,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Keeping (-1 1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of pm_linear_resolve_write_ok_TCC1.
Q.E.D.

C.117.14 Linear_Memory_Properties.pm_linear_resolve_write_ok

Terse proof for pm_linear_resolve_write_ok.

pm_linear_resolve_write_ok:

$$\{1\} \quad \forall (pm: Plain_Memory[Linear_memory], s: (pm'states), a: (pm'rw_addr)):$$

$$\text{is_linear_plain_memory?}(pm) \supset \text{OK?}(\text{linear_resolve}(a, \text{Write})(s))$$

Repeatedly Skolemizing and flattening,
Using lemma pm_linear_blessed,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of linear_blessed?,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Keeping (-9 1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of pm_linear_resolve_write_ok.
Q.E.D.

C.117.15

Linear_Memory_Properties.pm_linear_resolve_reg_transformers_other

Terse proof for pm_linear_resolve_reg_transformers_other.

pm_linear_resolve_reg_transformers_other:

Q.E.D.

C.117.17

Linear_Memory_Properties.pm_address_in_pt_range_in_rw_addr

Terse proof for `pm_address_in_pt_range_in_rw_addr`.

`pm_address_in_pt_range_in_rw_addr`:

$$\frac{\{1\} \quad \forall (pm: \text{Plain_Memory}[\text{Linear_memory}], s: \text{Linear_memory}[\text{Physical_memory}, pm_phy]): \\ \text{is_linear_plain_memory?}(pm) \wedge pm' \text{states}(s) \supset \\ (\text{address_in_pt_range?}(s, \text{restrict} [\text{Address}, \text{Memory_Address_4G}, \text{boolean}]((pm'ro_addr \cup pm'r$$

Repeatedly Skolemizing and flattening,

Using lemma `pm_linear_blessed`,

Expanding the definition of `linear_blessed?`,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Keeping (-7 1) and hiding *,

Case splitting on `union(restrict[Address, Memory_Address_4G, boolean](pm!1'ro_addr), restrict[Address, Memory_Address_4G, boolean](pm!1'rw_addr)) = restrict[Address, Memory_Address_4G, boolean] (union(pm!1'ro_addr, pm!1'rw_addr))`,

we get 2 subgoals:

`pm_address_in_pt_range_in_rw_addr.1`:

$$\frac{\begin{array}{l} \{-1\} \quad (\text{restrict} [\text{Address}, \text{Memory_Address_4G}, \text{boolean}] (pm'ro_addr) \cup \text{restrict} [\text{Address}, \text{Memory_Address_4G}, \text{boolean}] (pm'rw_addr)) \\ \quad = \text{restrict} [\text{Address}, \text{Memory_Address_4G}, \text{boolean}] ((pm'ro_addr \cup pm'rw_addr)) \\ \{-2\} \quad (\text{address_in_pt_range?}(s', (\text{restrict} [\text{Address}, \text{Memory_Address_4G}, \text{boolean}] (pm'ro_addr) \cup \text{restrict} [\text{Address}, \text{Memory_Address_4G}, \text{boolean}] (pm'rw_addr))) \\ \{1\} \quad (\text{address_in_pt_range?}(s', \text{restrict} [\text{Address}, \text{Memory_Address_4G}, \text{boolean}] ((pm'ro_addr \cup pm'rw_addr))) \end{array}}$$

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `pm_address_in_pt_range_in_rw_addr.1`.

`pm_address_in_pt_range_in_rw_addr.2`:

$$\frac{\begin{array}{l} \{-1\} \quad (\text{address_in_pt_range?}(s', (\text{restrict} [\text{Address}, \text{Memory_Address_4G}, \text{boolean}] (pm'ro_addr) \cup \text{restrict} [\text{Address}, \text{Memory_Address_4G}, \text{boolean}] (pm'rw_addr))) \\ \{1\} \quad (\text{restrict} [\text{Address}, \text{Memory_Address_4G}, \text{boolean}] (pm'ro_addr) \cup \text{restrict} [\text{Address}, \text{Memory_Address_4G}, \text{boolean}] (pm'rw_addr)) \\ \quad = \text{restrict} [\text{Address}, \text{Memory_Address_4G}, \text{boolean}] ((pm'ro_addr \cup pm'rw_addr)) \\ \{2\} \quad (\text{address_in_pt_range?}(s', \text{restrict} [\text{Address}, \text{Memory_Address_4G}, \text{boolean}] ((pm'ro_addr \cup pm'rw_addr))) \end{array}}$$

Keeping (1) and hiding *,

Applying `decompose-equality`,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `pm_address_in_pt_range_in_rw_addr.2`.

Q.E.D.

C.117.18

Linear_Memory_Properties.address_block_in_memory_TCC1

Terse proof for `address_block_in_memory_TCC1`.

address_block_in_memory_TCC1:

$\{1\} \quad \forall (pm: \text{Plain_Memory}[\text{Linear_memory}], a: \text{Address}, bl: \text{list}[\text{Byte}]):$ $\text{is_linear_plain_memory?}(pm) \wedge$ $(\text{address_block}(a, \text{length}(bl)) \subseteq (pm'ro_addr \cup pm'rw_addr)) \wedge \text{cons?}(bl)$ $\supset \text{Mem?}(\text{max_linear}'\text{type_of})$

Expanding the definition of max_linear,

Expanding the definition of Mem,

which is trivially true.

This completes the proof of address_block_in_memory_TCC1.

Q.E.D.

C.117.19 Linear_Memory_Properties.address_block_in_memory

Terse proof for address_block_in_memory.

address_block_in_memory:

$\{1\} \quad \forall (pm: \text{Plain_Memory}[\text{Linear_memory}], a: \text{Address}, bl: \text{list}[\text{Byte}]):$ $\text{is_linear_plain_memory?}(pm) \wedge$ $(\text{address_block}(a, \text{length}(bl)) \subseteq (pm'ro_addr \cup pm'rw_addr)) \wedge \text{cons?}(bl)$ $\supset a + \text{length}(bl) \leq \text{reg_size}(\text{max_linear})(\text{type_of}(a))$

Repeatedly Skolemizing and flattening,

Using lemma pm_memory_addr,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 2 subgoals:

address_block_in_memory.1:

$\{-1\} \quad \text{is_linear_plain_memory?}(pm')$ $\{-2\} \quad \text{in_memory}(\text{min_linear}, \text{max_linear})(a' + (\text{length}(bl') - 1))$ $\{-3\} \quad \text{Mem?}(\text{type_of}(a' + (\text{length}(bl') - 1)))$ $\{-4\} \quad \text{every}(\lambda (x: \text{number}):$ $\quad \text{number_field_pred}(x) \wedge$ $\quad \text{real_pred}(x) \wedge$ $\quad \text{rational_pred}(x) \wedge \text{integer_pred}(x) \wedge x \geq 0 \wedge x < \text{max_byte})$ $\quad (bl')$ $\{-5\} \quad (\text{address_block}(a', \text{length}(bl')) \subseteq (pm'ro_addr \cup pm'rw_addr))$ $\{-6\} \quad \text{cons?}(bl')$ <hr/> $\{1\} \quad a' + \text{length}(bl') \leq \text{reg_size}(\text{max_linear})(\text{type_of}(a'))$

Keeping (-4 1) and hiding *,
 Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of `apply_side_effects_unchanged.2.4`.
 Q.E.D.

C.117.28 `Linear_Memory_Properties.subset_ptab_address_rw_addr`

Terse proof for `subset_ptab_address_rw_addr`.

`subset_ptab_address_rw_addr`:

$\{1\} \quad \forall (pm: \text{Plain_Memory}[\text{Linear_memory}], s: \text{Linear_memory}[\text{Physical_memory}, pm_phy], \text{base}: \text{Memory_Address_4G}):$ $(\text{address_in_pt_range?}(s, (\text{restrict} [\text{Address}, \text{Memory_Address_4G}, \text{bool}](pm'ro_addr) \cup \text{restrict} [Address, \text{Memory_Address_4G}, \text{bool}](pm'rw_addr))) \wedge$ $(\text{address_block}(\text{base}, \text{expt}(2, pe_size)) \subseteq \text{extend} [\text{Address}, \text{Memory_Address_4G}, \text{bool}, \text{FALSE}](\text{address_block}(\text{base}, \text{expt}(2, pe_size)), pm_phy'rw_addr))) \subseteq pm_phy'rw_addr$

Repeatedly Skolemizing and flattening,

Case splitting on `union(restrict[Address, Memory_Address_4G, boolean](pm!1'ro_addr), restrict[Address, Memory_Address_4G, boolean](pm!1'rw_addr)) = restrict[Address, Memory_Address_4G, boolean](union(pm!1'ro_addr, pm!1'rw_addr))`,

we get 2 subgoals:

`subset_ptab_address_rw_addr.1`:

$\{-1\} \quad (\text{restrict} [Address, \text{Memory_Address_4G}, \text{bool}](pm'ro_addr) \cup \text{restrict} [Address, \text{Memory_Address_4G}, \text{bool}](pm'rw_addr)) = \text{restrict} [Address, \text{Memory_Address_4G}, \text{bool}](\text{union}(pm'ro_addr, pm'rw_addr))$ $\{-2\} \quad \text{Mem?}(\text{base}'\text{type_of})$ $\{-3\} \quad 0 \leq \text{base}'\text{offset}$ $\{-4\} \quad \text{base}'\text{offset} < \text{max_linear_offset}$ $\{-5\} \quad (\text{address_in_pt_range?}(s', (\text{restrict} [Address, \text{Memory_Address_4G}, \text{bool}](pm'ro_addr) \cup \text{restrict} [Address, \text{Memory_Address_4G}, \text{bool}](pm'rw_addr)))) \wedge$ $\{-6\} \quad (\text{address_block}(\text{base}', \text{expt}(2, pe_size)) \subseteq \text{extend} [Address, \text{Memory_Address_4G}, \text{bool}, \text{FALSE}](\text{address_block}(\text{base}', \text{expt}(2, pe_size)), pm_phy'rw_addr))) \subseteq pm_phy'rw_addr$
--

Replacing using formula -1,

Using lemma `subset_transitive`,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Keeping (-6 1) and hiding *,

Expanding the definition of `subset?`,

Repeatedly Skolemizing and flattening,

Instantiating the top quantifier in -2 with the terms: `(x!1)`,

we get 2 subgoals:

`subset_ptab_address_rw_addr.1.1`:

$\{-1\} \quad (x' \in \text{extend} [Address, \text{Memory_Address_4G}, \text{bool}, \text{FALSE}](\text{address_in_pt_range?}(s', \text{restrict} [Address, \text{Memory_Address_4G}, \text{bool}](pm'ro_addr) \cup \text{restrict} [Address, \text{Memory_Address_4G}, \text{bool}](pm'rw_addr)))) \wedge$ $\{-2\} \quad (x' \in \text{address_in_pt_range?}(s', \text{restrict} [Address, \text{Memory_Address_4G}, \text{bool}](\text{union}(pm'ro_addr, pm'rw_addr)))) \Rightarrow (x' \in \text{restrict} [Address, \text{Memory_Address_4G}, \text{bool}](pm_phy'rw_addr))$
$\{1\} \quad (x' \in pm_phy'rw_addr)$

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `subset_ptab_address_rw_addr.1.1`.

                                                                    lin_a,
                                                                    ac-
                                                                    cess,
                                                                    priv))),
                                  ((pm_phy'ro_addr ∪ pm_phy'rw_addr) \ address_block(pe_a

```

Repeatedly Skolemizing and flattening,

Letting `addr_set` name `difference(union(pm_phy'ro_addr, pm_phy'rw_addr), address_block(xlat_idx(lvl!1, base!1, lin_a!1), expt(2, pe_size)))`,

Using lemma `pm_states`,

Using lemma `pm_plain_phy`,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Replacing using formula -4,

Case splitting on `subset?(addr_set, union(pm_phy'ro_addr, pm_phy'rw_addr))`,

we get 2 subgoals:

translate_unchanged_pm_phy_except_pe.1:

<pre> {-1} (addr_set ⊆ (pm_phy'ro_addr ∪ pm_phy'rw_addr)) {-2} is_linear_plain_memory?(pm') {-3} plain_memory?(pm_phy) {-4} pm' states = pm_phy states {-5} ((pm_phy'ro_addr ∪ pm_phy'rw_addr) \ address_block(xlat_idx(lvl', base', lin_a'), expt(2, pe_size))) = addr_set {-6} lvl' < max_level {-7} Mem?(base' type_of) {-8} 0 ≤ base' offset {-9} base' offset < max_linear_offset {-10} aligned?(bits_per_level[Physical_memory, pm_phy] + pe_size)(offset(base')) {-11} Mem?(lin_a' type_of) {-12} 0 ≤ lin_a' offset {-13} lin_a' offset < max_linear_offset {-14} union(pm' ro_addr, pm' rw_addr)(lin_a') {-15} (address_block(xlat_idx(lvl', base', lin_a'), expt(2, pe_size)) ⊆ pm_phy'rw_addr) {-16} ∀ (s: (pm' states)): OK?(read_data(pm_phy, paging_data_type(lvl'))(xlat_idx(lvl', base', lin_a'))(s)) {-17} ∀ (s1, s2: (pm' states)): set_reference(data(read_data(pm_phy, paging_data_type(lvl')) (xlat_idx(lvl', base', lin_a'))(s1)), Write) = set_reference(data(read_data(pm_phy, paging_data_type(lvl')) (xlat_idx(lvl', base', lin_a'))(s2)), Write) </pre>	<pre> {1} unchanged_memory_invariant?(pm_phy' mem, pm_phy' states, singleton(expr_2_super(translate(lvl', base', lin_a', access', priv'))), addr_set) </pre>
--	---

Expanding the definition of translate,

Rewriting using plain_memory_unchanged_composition [Physical_memory, (range_pt(lvl!1)), [bool, Address]], matching in * where P gets LAMBDA (p: (range_pt(lvl!1))): FORALL (s: (pm_phy' states)): OK?(read_data(pm_phy, paging_data_type(lvl!1)) (xlat_idx(lvl!1, base!1, lin_a!1))(s)) IMPLIES set_reference(data(read_data(pm_phy, paging_data_type(lvl!1)) (xlat_idx(lvl!1, base!1, lin_a!1)) (s)), Write) = set_reference(p, Write), pm gets pm_phy, addresses gets addr_set,

we get 4 subgoals:

translate_unchanged_pm_phy_except_pe.1.1:

C.117 Proofs for Linear_Memory_Properties (challenge-linear.pvs)

Hiding formulas: 2,

Using lemma `plain_memory_unchanged_memory_invariant_read_data` [`Physical_memory`, `(range_pt(lvl'))`],

Using lemma `unchanged_memory_invariant_mono`,

Expanding the definition of `in_blessed_memory?`,

Rewriting using `subset_reflexive`, matching in `*`,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Rewriting using `paging_data_type_size`, matching in `*`,

Simplifying, rewriting, and recording with decision procedures,

Keeping `(-15 3)` and hiding `*`,

Rewriting using `subset_transitive`, matching in `*` where `a` gets `address_block(xlat_idx(lvl!1, base!1, lin_a!1), expt(2, pe_size))`, `b` gets `pm_phy'rw_addr`, `c` gets `union(pm_phy'ro_addr, pm_phy'rw_addr)`,

Rewriting using `union_subset3`, matching in `*`,

This completes the proof of `translate_unchanged_pm_phy_except_pe.1.2`.

translate_unchanged_pm_phy_except_pe.1.3:

Linear_Memory_Properties.linear_resolve_unchanged_pm_phy

Terse proof for `linear_resolve_unchanged_pm_phy`.

`linear_resolve_unchanged_pm_phy`:

<p>{1} \forall (pm: Plain_Memory[Linear_memory], s: Linear_memory[Physical_memory, pm_phy], addr: Memory_Address_4G, access: Memory_access): union(pm'ro_addr, pm'rw_addr)(addr) \wedge is_linear_plain_memory?(pm) \wedge pm'states(s) \supset unchanged_memory_invariant?[Physical_memory] (pm_phy'mem, pm'states, singleton(expr_2_super[Physical_memory, Address](linear_resolve(addr, ac- cess))), ((pm_phy'ro_addr \cup pm_phy'rw_addr) \ extend [Address, Memory_Address_4G, bool, F</p>

Installing automatic rewrites from: `plain_memory_unchanged_memory_ok_result`

Repeatedly Skolemizing and flattening,

Letting addresses name difference(union(pm_phy'ro_addr, pm_phy'rw_addr), extend[Address, Mem-
 ory_Address_4G, bool, FALSE] (address_in_pt_range?(s!1, restrict [Address, Memory_Address_4G,
 boolean] (union (pm!1'ro_addr, pm!1'rw_addr))))),

Replacing using formula -1,

Case splitting on subset?(addresses, union(pm_phy'ro_addr, pm_phy'rw_addr)),

we get 2 subgoals:

`linear_resolve_unchanged_pm_phy.1`:

<p>{-1} (addresses \subseteq (pm_phy'ro_addr \cup pm_phy'rw_addr)) {-2} ((pm_phy'ro_addr \cup pm_phy'rw_addr) \ extend [Address, Memory_Address_4G, bool, FALSE](ad- = addresses {-3} Mem?(addr' 'type_of) {-4} $0 \leq$ addr' 'offset {-5} addr' 'offset < max_linear_offset {-6} union(pm' 'ro_addr, pm' 'rw_addr)(addr') {-7} is_linear_plain_memory?(pm') {-8} pm' 'states(s')</p>
<p>{1} unchanged_memory_invariant?[Physical_memory] (pm_phy'mem, pm'states, singleton(expr_2_super[Physical_memory, Address](linear_resolve(addr', access'))), addresses)</p>

Expanding the definition of `linear_resolve`,

Using lemma `pm_plain_phy`,

Using lemma `pm_states`,

Simplifying, rewriting, and recording with decision procedures,

Replacing using formula -1,

Installing automatic rewrites from: (has_next_state! max_level! bits_per_level! bus_width! pe_size!
 singleton! <! Mem! max_linear!)

Copying formula number: -9

Expanding the definition of `is_linear_plain_memory?`,

Applying disjunctive simplification to flatten sequent,

Installing automatic rewrites from: pdir_lvl!! ptab_lvl!!

Case splitting on FORALL (cs: Segment_Reg_type, pdir: Pdir_type, leaf: bool, base: {b: Memory_Address_4G | IF leaf THEN aligned?(-1 * (pdir_lvl[Physical_Memory, pm_phy] * bits_per_level [Physical_Memory, pm_phy]) - bits_per_level [Physical_Memory, pm_phy] + bus_width) (offset(b)) ELSE aligned?(bits_per_level [Physical_Memory, pm_phy] + pe_size) (offset(b)) ENDIF}): NOT leaf IMPLIES (FORALL (x1: Physical_Memory): every[Physical_Memory, [bool, Address]] (LAMBDA (x: Physical_Memory): TRUE, LAMBDA (t: [bool, Address]): Mem?(t'2'type_of) AND 0 <= t'2'offset AND t'2'offset < max_linear_offset) (translate[Physical_Memory, pm_phy] (1, base, addr!1, access!1, segment_to_priv(cs))(x1))), FORALL (cs: Segment_Reg_type, pdir: Pdir_type): FORALL (x1: Physical_Memory): every[Physical_Memory, [bool, Address]] (LAMBDA (x: Physical_Memory): TRUE, LAMBDA (t: [bool, Address]): Mem?(t'2'type_of) AND (0 <= t'2'offset AND t'2'offset < max_linear_offset) AND IF t'1 THEN aligned?(22)(offset(t'2)) ELSE aligned?(12)(offset(t'2)) ENDIF) (translate[Physical_Memory, pm_phy] (0, pdir'base_addr, addr!1, access!1, segment_to_priv(cs)) (x1)),

we get 5 subgoals:

This completes the proof of `linear_resolve_same_result.3`.
Q.E.D.

C.117.56 Linear_Memory_Properties.delta_memory_address

Terse proof for `delta_memory_address`.

`delta_memory_address:`

{1}	$\forall (\text{addr}: \text{Memory_Address_4G}, \delta: \text{nat}):$ $\text{rem}(\text{expt}(2, \text{min_page}))(\text{offset}(\text{addr})) + \delta < \text{expt}(2, \text{min_page}) \supset$ $\text{offset}(\text{addr} + \delta) < \text{max_linear_offset}$
-----	--

Repeatedly Skolemizing and flattening,
Expanding the definition of `+`,
Using lemma `aligned_add_below`,
we get 2 subgoals:

delta_memory_address.1:

{-1}	$\text{min_page} \leq \text{bus_width} \wedge$ $\text{offset}(\text{addr}') - \text{rem}(\text{expt}(2, \text{min_page}))(\text{offset}(\text{addr}')) < \text{expt}(2, \text{bus_width})$ \wedge $\text{aligned}?(\text{min_page})(\text{offset}(\text{addr}') - \text{rem}(\text{expt}(2, \text{min_page}))(\text{offset}(\text{addr}')))$ $\wedge \text{rem}(\text{expt}(2, \text{min_page}))(\text{offset}(\text{addr}')) + \text{delta}' < \text{expt}(2, \text{min_page})$ \supset $\text{offset}(\text{addr}') - \text{rem}(\text{expt}(2, \text{min_page}))(\text{offset}(\text{addr}')) + \text{rem}(\text{expt}(2, \text{min_page}))(\text{offset}(\text{addr}')) + \text{delta}'$ $< \text{expt}(2, \text{bus_width})$
{-2}	$\text{Mem}?(\text{addr}' \text{'type_of})$
{-3}	$0 \leq \text{addr}' \text{'offset}$
{-4}	$\text{addr}' \text{'offset} < \text{max_linear_offset}$
{-5}	$\text{delta}' \geq 0$
{-6}	$\text{rem}(\text{expt}(2, \text{min_page}))(\text{offset}(\text{addr}')) + \text{delta}' < \text{expt}(2, \text{min_page})$
{1}	$\text{addr}' \text{'offset} + \text{delta}' < \text{max_linear_offset}$

Installing automatic rewrites from: (min_page! bus_width! max_linear_offset!)

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Using lemma rem_def2,

Expanding the definition of aligned?,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of delta_memory_address.1.

delta_memory_address.2:

{-1}	$\text{Mem}?(\text{addr}' \text{'type_of})$
{-2}	$0 \leq \text{addr}' \text{'offset}$
{-3}	$\text{addr}' \text{'offset} < \text{max_linear_offset}$
{-4}	$\text{delta}' \geq 0$
{-5}	$\text{rem}(\text{expt}(2, \text{min_page}))(\text{offset}(\text{addr}')) + \text{delta}' < \text{expt}(2, \text{min_page})$
{1}	$\text{offset}(\text{addr}') - \text{rem}(\text{expt}(2, \text{min_page}))(\text{offset}(\text{addr}')) \geq 0$
{2}	$\text{addr}' \text{'offset} + \text{delta}' < \text{max_linear_offset}$

Using lemma rem_floor,

Case splitting on $\text{expt}(2, \text{min_page}) * \text{floor}(\text{offset}(\text{addr}') / \text{expt}(2, \text{min_page})) \geq 0$,

we get 2 subgoals:

delta_memory_address.2.1:

{-1}	$\text{expt}(2, \text{min_page}) \times \text{floor}(\text{offset}(\text{addr}') / \text{expt}(2, \text{min_page})) \geq 0$
{-2}	$\text{offset}(\text{addr}') =$ $\text{rem}(\text{expt}(2, \text{min_page}))(\text{offset}(\text{addr}')) + \text{expt}(2, \text{min_page}) \times \text{floor}(\text{offset}(\text{addr}') / \text{expt}(2, \text{min_page}))$
{-3}	$\text{Mem}?(\text{addr}' \text{'type_of})$
{-4}	$0 \leq \text{addr}' \text{'offset}$
{-5}	$\text{addr}' \text{'offset} < \text{max_linear_offset}$
{-6}	$\text{delta}' \geq 0$
{-7}	$\text{rem}(\text{expt}(2, \text{min_page}))(\text{offset}(\text{addr}')) + \text{delta}' < \text{expt}(2, \text{min_page})$
{1}	$\text{offset}(\text{addr}') - \text{rem}(\text{expt}(2, \text{min_page}))(\text{offset}(\text{addr}')) \geq 0$
{2}	$\text{addr}' \text{'offset} + \text{delta}' < \text{max_linear_offset}$

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of delta_memory_address.2.1.

delta_memory_address.2.2:

{-1}	offset(addr') =
{-2}	Mem?(addr' type_of)
{-3}	0 ≤ addr' offset
{-4}	addr' offset < max_linear_offset
{-5}	delta' ≥ 0
{-6}	rem(expt(2, min_page))(offset(addr')) + delta' < expt(2, min_page)
{1}	expt(2, min_page) × floor(offset(addr')/expt(2, min_page)) ≥ 0
{2}	offset(addr') - rem(expt(2, min_page))(offset(addr')) ≥ 0
{3}	addr' offset + delta' < max_linear_offset

Using lemma nonneg_floor_is_nat,
we get 2 subgoals:

delta_memory_address.2.2.1:

{-1}	floor(offset(addr')/expt(2, min_page)) ≥ 0
{-2}	offset(addr') =
{-3}	Mem?(addr' type_of)
{-4}	0 ≤ addr' offset
{-5}	addr' offset < max_linear_offset
{-6}	delta' ≥ 0
{-7}	rem(expt(2, min_page))(offset(addr')) + delta' < expt(2, min_page)
{1}	expt(2, min_page) × floor(offset(addr')/expt(2, min_page)) ≥ 0
{2}	offset(addr') - rem(expt(2, min_page))(offset(addr')) ≥ 0
{3}	addr' offset + delta' < max_linear_offset

Rewriting using nnreal_times_nnreal_is_nnreal, matching in *,
This completes the proof of delta_memory_address.2.2.1.

delta_memory_address.2.2.2:

{-1}	offset(addr') =
{-2}	Mem?(addr' type_of)
{-3}	0 ≤ addr' offset
{-4}	addr' offset < max_linear_offset
{-5}	delta' ≥ 0
{-6}	rem(expt(2, min_page))(offset(addr')) + delta' < expt(2, min_page)
{1}	offset(addr')/expt(2, min_page) ≥ 0
{2}	expt(2, min_page) × floor(offset(addr')/expt(2, min_page)) ≥ 0
{3}	offset(addr') - rem(expt(2, min_page))(offset(addr')) ≥ 0
{4}	addr' offset + delta' < max_linear_offset

Rewriting using nnreal_div_posreal_is_nnreal, matching in *,
This completes the proof of delta_memory_address.2.2.2.
Q.E.D.

C.117.57

Linear_Memory_Properties.xlat_idx_same_page_address_TCC1

Terse proof for xlat_idx_same_page_address_TCC1.

xlat_idx_same_page_address_TCC1:

{1} \forall (addr: Memory_Address_4G, lvl: Level, a: Memory_Address_4G): offset(a) \geq 0

Trying repeated skolemization, instantiation, and if-lifting,
 This completes the proof of xlat_idx_same_page_address_TCC1.
 Q.E.D.

C.117.58

Linear_Memory_Properties.xlat_idx_same_page_address_TCC2

Terse proof for xlat_idx_same_page_address_TCC2.

xlat_idx_same_page_address_TCC2:

{1} \forall (addr: Memory_Address_4G, δ : nat, lvl: Level,
 base:
 {a: Memory_Address_4G |
 aligned?(bits_per_level[Physical_memory, pm_phy] + pe_size)
 (offset(a))}):
 rem(expt(2, min_page))(offset(addr)) + δ < expt(2, min_page) \supset
 0 \leq (addr + δ)'offset \wedge (addr + δ)'offset < max_linear_offset

Repeatedly Skolemizing and flattening,
 Rewriting using delta_memory_address, matching in *,
 Expanding the definition of +,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 This completes the proof of xlat_idx_same_page_address_TCC2.
 Q.E.D.

C.117.59 Linear_Memory_Properties.xlat_idx_same_page_address

Terse proof for xlat_idx_same_page_address.

xlat_idx_same_page_address:

{1} \forall (addr: Memory_Address_4G, δ : nat, lvl: Level,
 base:

Keeping (-2 1) and hiding `*`,

Using lemma `divides_expt_gt`,

Rewriting using `divides_reflexive`, matching in `*`,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `xlat_idx_same_page_address.1.2.1.2.1.1.2`.

xlat_idx_same_page_address.1.2.1.2.1.2:

<pre> {-1} rem(expt(2, 12))(offset(addr')) + delta' < expt(2, 12) {-2} 22 - 10 × lvl' ≥ 0 {-3} delta' ≥ 0 {-4} lvl' < 2 {-5} aligned?(10 + pe_size)(offset(base')) </pre>	<hr style="border: 0.5px solid black;"/> <pre> {1} rem(expt(2, 22 - 10 × lvl'))(offset(addr')) - rem(expt(2, 12))(offset(addr')) < expt(2, 22 - 10 × lvl') {2} rem(expt(2, 22 - 10 × lvl'))(offset(addr')) + delta' < expt(2, 22 - 10 × lvl') </pre>
--	--

Adding type constraints for $\text{rem}(\text{expt}(2, \text{bus_width} - \text{bits_per_level} - \text{bits_per_level} * \text{lvl}1))$ ($\text{offset}(\text{addr}1)$),

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of xlat_idx_same_page_address.1.2.1.2.1.2.

xlat_idx_same_page_address.1.2.1.2.2:

<pre> {-1} bus_width - bits_per_level - bits_per_level × lvl' ≥ 0 {-2} delta' ≥ 0 {-3} lvl' < max_level {-4} aligned?(bits_per_level + pe_size)(offset(base')) {-5} rem(expt(2, min_page))(offset(addr')) + delta' < expt(2, min_page) </pre>	<hr style="border: 0.5px solid black;"/> <pre> {1} rem(expt(2, 22 - 10 × lvl'))(offset(addr')) - rem(expt(2, 12))(offset(addr')) ≥ 0 {2} rem(expt(2, 22 - 10 × lvl'))(offset(addr')) + delta' < expt(2, 22 - 10 × lvl') </pre>
--	---

Using lemma `rem_floor`,

we get 2 subgoals:

xlat_idx_same_page_address.1.2.1.2.2.1:

<pre> {-1} rem(expt(2, bus_width - bits_per_level - bits_per_level × lvl')) (offset(addr')) = rem(expt(2, 12))(rem(expt(2, bus_width - bits_per_level - bits_per_level × lvl'))(offset(addr'))) + expt(2, 12) {-2} bus_width - bits_per_level - bits_per_level × lvl' ≥ 0 {-3} delta' ≥ 0 {-4} lvl' < max_level {-5} aligned?(bits_per_level + pe_size)(offset(base')) {-6} rem(expt(2, min_page))(offset(addr')) + delta' < expt(2, min_page) </pre>	<hr style="border: 0.5px solid black;"/> <pre> {1} rem(expt(2, 22 - 10 × lvl'))(offset(addr')) - rem(expt(2, 12))(offset(addr')) ≥ 0 {2} rem(expt(2, 22 - 10 × lvl'))(offset(addr')) + delta' < expt(2, 22 - 10 × lvl') </pre>
---	---

Rewriting using `rem_rem`, matching in `*`,

we get 2 subgoals:

C Proof scripts

xlat_idx_same_page_address.1.2.1.2.2.1.1.1:

C.117 Proofs for Linear_Memory_Properties (challenge-linear.pvs)

Using lemma `translate_same_page_address_ok`,

Using lemma `translate_same_page_address_result`,

Expanding the definition of `linear_resolve`,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `linear_resolve_same_page_address_ok.1`.

linear_resolve_same_page_address_ok.2:

```

{-1} Mem?(addr' 'type_of)

C.117.68

Linear_Memory_Properties.linear_resolve_same_page_address

The L^AT_EX code for this proof is broken.

C.117.69 Linear_Memory_Properties.address_block_split_type

Terse proof for address_block_split_type.

address_block_split_type:

$\{1\} \quad \forall (\text{pm}: \text{Plain_Memory}[\text{Linear_memory}], a: \text{Memory_Address_4G}, \text{bl}: \text{list}[\text{Byte}]):$ $\text{is_linear_plain_memory}?(\text{pm}) \wedge$ $(\text{address_block}(a, \text{length}(\text{bl})) \subseteq (\text{pm}'\text{ro_addr} \cup \text{pm}'\text{rw_addr}))$ \supset $\text{every}(\lambda (t: [\text{Address}, \text{list}[\text{Byte}]]):$ $\text{Mem}?(t'1'\text{type_of}) \wedge 0 \leq t'1'\text{offset} \wedge t'1'\text{offset} < \text{max_linear_offset}$ $(\text{split}(\text{min_page}, a, \text{bl}))$

Repeatedly Skolemizing and flattening,
 Using lemma split_type,
 Using lemma address_block_in_memory,
 Using lemma address_block_in_memory2,
 Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
 we get 3 subgoals:

C Proof scripts

address_block_split_type.1:

{-1}	is_linear_plain_memory?(pm')
{-2}	(address_block(a', length(bl')) \subseteq (pm'ro_addr \cup pm'rw_addr))
{-3}	$0 \leq a'$ 'offset
{-4}	$a' + \text{length}(bl') \leq \text{reg_size}(\text{max_linear})(\text{type_of}(a'))$
{-5}	every(λ (t: [Address, list[Byte]]): type_of(t'1) = type_of(a') \wedge reg_base(min_linear)(type_of(a')) \leq t'1 \wedge t'1 < reg_size(max_linear)(type_of(a')) (split(min_page, a', bl'))
{-6}	Mem?(a' type_of)
{-7}	a' 'offset < max_linear_offset
{-8}	every(λ (x: number): number_field_pred(x) \wedge real_pred(x) \wedge rational_pred(x) \wedge integer_pred(x) \wedge $x \geq 0 \wedge x < \text{max_byte}$ (bl'))
{1}	every(λ (t: [Address, list[Byte]]): Mem?(t'1 type_of) \wedge $0 \leq t'1$ 'offset \wedge $t'1$ 'offset < max_linear_offset (split(min_page, a', bl'))

Hiding formulas: (-8),

Using lemma every_implied,

we get 2 subgoals:

address_block_split_type.1.1:
